Section 8. Peak Power Output

NAME OF TEST: Peak Power Output	PARA. NO.: 15.247 (b)
TESTED BY: Russell Grant	DATE: September 18, 1998

Test Results: Complies. The maximum peak power output of the transmitter is 19.0 dBm.

Measurement Data: Detachable antenna? ☒ Yes ☐ No
If yes, state the type of non-standard connector used at the antenna port: Reverse Gender TNC

Directional Gain of Antenna: 24 dBi, 14 dBi.
Peak Power Output: 19.0 dBm.

Antennas:

Model	Type	Manufacturer	Gain	E.I.R.P.
HG2424GC	Reflector Grid	Hyperlink	24 dBi	43 dBm
HG2414Y	Yagi	Hyperlink	14 dBi	33 dBm

Note: The 24 dBi Reflector Grid Antenna exceeds 6 dBi by 18 dB. However, this antenna is used for point to point applications. Therefore, the power output must be reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6 dBi. This is $18/3 = 6$ dB power reduction. The power output must not exceed $30-6 = 24$ dBm. The manufacturers rated power output is 20 dBm. The measured power output is 19.0 dBm.

The 14 dBi Yagi antenna exceeds 6 dBi by 8 dB. Therefore, the power output must not exceed $30-8 = 22$ dBm.

VBW: >RBW

Span: Sufficient to display 20 dB bandwidth

LOG dB/div.: 10 dB

Sweep: Auto

Standard Test Voltage

Minimum Standard: The maximum peak power output shall not exceed 1 watt.
If transmitting antennas of directional gain greater than 6 dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

Direct Measurement Method For Detachable Antennas:

If the antenna is detachable, a peak power meter is used to measure the power output with the transmitter operating into a 50 ohm load.

Calculation Of EIRP For Integral Antenna:

If the antenna is not detachable from the circuit then the Peak Power Output is derived from the peak radiated field strength of the fundamental emission by using the plane wave relation

$GP/4\pi R^2 = E^2/120\pi$ and proceeding as follows:

$$P = \frac{E^2 R^2}{30G} = \frac{E^2 3^2}{30G}$$

where,

P = the equivalent isotropic radiated power in watts

E = the maximum measured field strength in V/m

R = the measurement range (3 meters)

G = the numeric gain of the transmit antenna in relation to an isotropic radiator

The RBW of the spectrum analyzer shall be set to a value greater than the measured 20 dB occupied bandwidth of the E.U.T.
