

TEST: FIELD STRENGTH OF RADIATED EMISSIONS

Grantee: SmartTire Systems, Inc.

FCC ID: NATPC433BP

Model: 200.0054

Setup:

The equipment under test (EUT) was configured and operated in accordance with the applicable provisions of ANSI C63.4-1992, Section 6, 12. Measurements were made in accordance with applicable paragraphs of Section 8.2.2 and 8.2.3, Section 12.1.1.1 Appendix D, Section 12.1.4 and Appendix H3 and H4.

The EUT was placed on a 1 by 1.5 meter table located 40 cm above a 2 meter diameter non-metallic turntable that sits 40 cm above the 15 X 30 meter ground plane at Spectrum's Open Area Test Site. The bi-conical or log-periodic antenna was mounted on a tower spaced at a three meters distance, and arranged for adjustment in height (1-4 meters) and vertical/horizontal polarization to maximize the emissions levels when combined with turntable rotation of the EUT. The dual ridged guide antenna was mounted on a tripod at one meter height and adjusted for vertical or horizontal antenna orientation. An HP 8562A spectrum analyzer with an HP 8447F, Option H64 amplifier and an HP 83006A pre-amplifier were used for the peak measuring instrumentation.

Discussion:

No modifications were required prior to the final radiated emissions measurements reported herein.

The EUT is a 433.92 MHz receiver used in the SmartTire Passenger Car Tire Monitoring system. The receiver would be installed in a passenger vehicle and used to receive signals and display status of passenger tire pressure sensors installed on the wheels. A transmitter and sensor would be installed within the tire on each of the four wheels with each transmitter reporting back to the Receiver once per minute for with pressure status and once every minute and a half with temperature status or approximately every thirty seconds while the vehicle is in motion at speeds in excess of ten miles per hour.

Measurements were made with the EUT receiver operating on it's nominal 433.92 (+/- .1)MHz. Preliminary measurements were made as described in Section 8.3.11 and 13.1.4.1 with the receiver operating as described. During preliminary measurements only four emissions in total were detected with the receive antenna and EUT in close proximity. With the aid of an amplifier and moving in to less than 50 cm EUT to antenna distance for frequencies above 1 GHz, a low level at the 3rd and 4th harmonics were observed just above the noise floor.

The EUT configuration is detailed in the photographs included with this report.

The final set of measurements as specified in Section 8.3.1.2 and 13.1.4.2 were made as specified in Section 13.1.1. The receiver was observed while positioned in three mutually orthogonal planes with the horizontal position "on its back", the worst case. The EUT 12 VDC power cord and the receivers attached wire antenna were manipulated to different positions endeavoring to maximize the measured levels. The EUT was 12 VDC powered from an Astron VS-35-M external power supply during all of the measurements. RBW and VBW of 100 kHz was used for measurements below 1 GHz. Above 1 GHz peak measurements were made with a RBW and VBW of 1 MHz. We also endeavored to maximize levels of the emissions with EUT rotation and adjustment of antenna height.

Measurements were made over the frequency range of 30 - 5000 MHz with only two emissions measurable at three meters and reported below. The fundamental and the second harmonic were the only emissions measurable at three meters during the final detailed radiated emissions measurements. An HP 8447F pre-amplifier was used during the measurements. The third and fourth harmonics were just measurable above the noise floor at <.5 meters spacing and 100 kHz RBW however, not measurable at three meters during the final measurements.

FCC Part 15.109(b) Field Strength of Radiated Spurious Emissions
Final Data - Ref. SMARTIRE.R10

Grantee: SmarTire Systems, Inc.
FCC ID: NATPC433BP

12/17/98

Radiated Emissions Measurements By Frequency

Freq MHz	Vert dBm	Horz dBm	Ant-F	dBuV/m	uV/m	 dB +/- Limit	
						Limit	uV/m @ 3 Meters
433.44	-89.33	-91.33	21.2	38.87	87.80	- 7.15	200
866.88	-104.67	-102.33	28.8	33.47	47.15	-12.55	200

No receiver antenna conducted emissions measurements were made as the EUT has a permanently attached wire antenna so we were unable to directly connect the spectrum analyzer to the receiver to recorded the antenna conducted spurious emissions.

Conclusion:

The SmarTire Systems, Inc., FCC ID: NATPC433BP, when operated and measured as discussed above, meets the receiver radiated spurious emissions requirements under Title 47, CFR Part 15.109(a). **This receiver is not subject to the transition provisions of Part 15.37.**
