1. General Information

1.1 Administrative Information

Manufacturer:	Attenti US, Inc.
Manufacturer's Address:	1838 Gunn Highway, Odessa, Florida 33556, United States
Equipment Under Test (E.U.T):	Electronic Monitoring Tracking Device
Equipment Model:	Bracelet 100
Equipment Serial No.:	BCL-100-0-9-00
Date of Receipt of E.U.T:	January 01, 2023
Start of Test:	January 01, 2023
End of Test:	January 01, 2023
Test Laboratory Location:	I.T.L. (Product Testing) Ltd. 1 Bat Sheva St., Lod 7120101, Israel
Test Specifications:	FCC Part 15, Subpart C

1.2 List of Accreditations

The EMC laboratory of I.T.L. is accredited by the following bodies:

1. The American Association for Laboratory Accreditation (A2LA) (U.S.A.), Certificate No. 1152.01.
2. The Federal Communications Commission (FCC) (U.S.A.), FCC Designation No. IL1005.
3. Department of Innovation, Science and Economic Development (ISED) Canada, CAB identifier: IL1002

I.T.L. Product Testing Ltd. is accredited by the American Association for Laboratory Accreditation (A2LA) and the results shown in this test report have been determined in accordance with I.T.L.'s terms of accreditation unless stated otherwise in the report.

1.3 Product Description

The Bracelet 100 device is a body worn unit, powered by an internal 3V primary battery. The device is part of Attenti Curfew's monitoring system. It contains an SRD transceiver. Its operating frequency band is: 901-928 Mhz.

Type of Equipment							
☒	Stand Alone (Equipment with/without its own control provisions)						
☐	Combined (Equipment where radio part is fully integrated with another type of equipment)						
☐	Plug in card (Equipment intended for a variety of host systems)						
Intended Use				Condition of use			
☐	Fixed			Always of distance >2m from the people			
☐	Mobile			Always of distance >20cm from the people			
☒	Portable			Always of distance <20cm to human body			
Assigned frequency band				902-928MHz			
Operational frequencies				915MHz			
Maximum rated output power				At transmitter 50Ω RF output connector [dBm]		18dBm	
				Effective Radiated Power (for equipment without RF connector)			
Antenna Connection							
☐	Unique Coupling	☐	Standard Connection	☒	Integral	☒	With temporary RF connector
						☐	Without temporary RF connector
Antenna Gain(peak)				-9dBi (Peak)			
Operating channel bandwidth				500kHz			
Type of modulation				GFSK			
Bit rate				50Kbps			
Maximum transmitter duty cycle				0.05% at operative mode , 100% at "test mode"			
Transmitter power source							
☐	AC			Nominal rated voltage			
☐	DC			Nominal rated voltage			
☒	Battery			Nominal rated voltage		3.7V	

1.4 Test Methodology

Both conducted and radiated testing was performed according to the procedures in KDB 558074 D01 v03r05 and ANSI C63.10: 2013. Radiated testing was performed at an antenna to EUT distance of 3 meters.

1.5 Test Facility

Emissions tests were performed at I.T.L.'s testing facility in Lod, Israel. I.T.L.'s EMC Laboratory is accredited by A2LA, certificate No. 1152.01 and its FCC Designation Number is IL1005.

1.6 Measurement Uncertainty

Conducted Emission

Conducted Emission (CISPR 11, EN 55011, CISPR 22, EN 55022, ANSI C63.4)

0.15-30 MHz:

Expanded Uncertainty (95% Confidence, K=2):

± 3.44 dB

Radiated Emission

Radiated Emission (CISPR 11, EN 55011, CISPR 22, EN 55022, ANSI C63.4) for open site:

30-1000MHz:

Expanded Uncertainty (95% Confidence, K=2):

± 4.96 dB

1 GHz to 6 GHz

Expanded Uncertainty (95% Confidence, K=2):

± 5.19 dB

>6 GHz

Expanded Uncertainty (95% Confidence, K=2):

± 5.51 dB

2. System Test Configuration

2.1 Justification

1. The E.U.T contains a transceiver that uses DTS protocol in sub-Giga band.
2. The unit was evaluated while transmitting in the operation frequency: 915.0MHz.
3. Conducted emission tests were performed with the E.U.T. antenna terminal connected by an RF cable to the Spectrum Analyzer, through a 30dB external attenuator.
4. Final radiated emission tests were performed after exploratory emission testing that was performed in 3 orthogonal polarities to determine the “worst case” radiation.
5. According to screening results below, the “worst case” was the X axis

Orientation	Frequency	2 nd Harmonic	3 rd Harmonic
	(MHz)	(dBuV/m)	(dBuV/m)
Y axis	915.0	57.4	60.1
X axis	915.0	58.4	61.3
Z axis	915.0	57.8	60.6

6. Figure 1. Screening Results

2.2 EUT Exercise Software

No special exercise software was used.

2.3 Special Accessories

No special accessory was used.

2.4 Equipment Modifications

Initially, the E.U.T failed in the restricted bands radiated spurious emissions testing, with exceeding value of 8dB. The applicant assembled a metallic cover (shielding) on the transmitter's chip and PCB, and reduced the power level to 18dBm (code level).

2.5 Configuration of Tested System

Figure 2. Configuration of Tested System Conducted

Figure 3. Configuration of Tested System Radiated

3. Setup Photos

See a separate document.

4. 6 dB Minimum Bandwidth

4.1 Test Specification

FCC Part 15, Subpart C, Section 247(a)(2)

4.2 Test Procedure

(Temperature (20°C)/ Humidity (62%RH))

The E.U.T operation mode and test set-up are as described in Section 2 of this report.

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (total loss=31dB). Special attention was taken to prevent Spectrum Analyzer RF input overload.

The spectrum bandwidth of the E.U.T. at the point of 6 dB below maximum peak power was measured and recorded.

The RBW was set to 100 kHz.

4.3 Test Limit

Systems using digital modulation techniques may operate in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands. The minimum 6 dB bandwidth shall be at least 500 kHz.

4.4 Test Results

Operation Frequency	Reading	Limit
(MHz)	(kHz)	(kHz)
915.0	648.0	>500.0

Figure 4 6 dB Minimum Bandwidth

JUDGEMENT: Passed

For additional information see *Figure 5*.

5. Occupied Bandwidth

5.1 Test Specification

FCC, Part 15, Subpart C, Section 2.1049

5.2 Test Procedure

(Temperature (20°C)/ Humidity (62%RH))

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable. The transmitter unit operated with normal modulation.

The spectrum analyzer was set to the following parameters:

- Span between 1.5 times and 5.0 times the OBW.
- RBW in the range of 1% to 5% of the OBW.
- Detector Function: Peak, Trace: Maximum Hold.
- 99% occupied bandwidth function set on.

6. Maximum (Average) Conducted Output Power

6.1 Test Specification

FCC, Part 15, Subpart C, Section 247(b)(3)

6.2 Test Procedure

(Temperature (20°C)/ Humidity (62%RH))

The E.U.T operation mode and test set-up are as described in Section 2 of this report. The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (total loss=31dB). Special attention was taken to prevent Spectrum Analyzer RF input overload.

Evaluation method performed according to ANSI C63.10, Section 11.9.2.2.2: AVGSA-1

Radiated output power levels were measured at selected operation frequencies and the results were converted to power level according to the formula as shown below:

6.3 Test Limit

The maximum peak conducted output power of the intentional radiator for systems using digital modulation in the 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz bands: 1 Watt.

6.4 Test Results

Protocol Type	Operation Frequency	Average Reading	Power	Limit	Margin

7. Band Edge Spectrum

7.1 Test Specification

FCC, Part 15, Subpart C, Section 247(d)

7.2 Test Procedure

(Temperature (20°C)/ Humidity (62%RH))

The E.U.T operation mode and test set-up are as described in Section 2 of this report. The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (loss=31.0 dB). Special attention was taken to prevent Spectrum Analyzer RF input overload.

The RBW was set to 100 kHz.

7.3 Test Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB

7.4 Test Results

Figure 16 Test Equipment Used

8. Emissions in non-Restricted Frequency Bands

8.1 Test Specification

FCC, Part 15, Subpart C, Section 247(d)

8.2 Test Procedure

(Temperature (20°C)/ Humidity (62%RH))

The E.U.T. operation mode and test set-up are as described in Section 2 of this report.

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (max total loss=32.0 dB).

Special attention was taken to prevent Spectrum Analyzer RF input overload.

RBW was set to 100 kHz, detector set to max peak and trace to “max hold”.

8.3 Test Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB

8.4 Test Results

JUDGEMENT: Passed

The EUT met the requirements of the FCC Part 15, Subpart C, Section 247(d) specification.

Figure 17 915.0MHz

Note: All exceeds peaks in plot are the fundamental transmission frequency.

9. Emissions in Restricted Frequency Bands

9.1 Test Specification

FCC Part 15, Subpart C, Sections 15.209, 15.205, 15.247(d)

9.2 Test Procedure

(Temperature (23°C)/ Humidity (55%RH))

The E.U.T. operation mode and test set-up are as described in Section 2 of this report.

For measurements between 0.009-30MHz:

The E.U.T was tested inside the shielded room and placed on a non-metallic table, 0.8 meters above the ground. The emissions were measured at a distance of 3 meters. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization.

The frequency range 0.009MHz-30MHz was scanned.

For measurements between 30-1000MHz:

A preliminary measurement to characterize the E.U.T was performed inside the shielded room at a distance of 3 meters, using peak detection mode and broadband antennas. The preliminary measurements produced a list of the highest emissions. The E.U.T was then transferred to the open site, and placed on a remote-controlled turntable. The E.U.T was placed on a non-metallic table, 0.8 meters above the ground. The emissions were measured at a distance of 3 meters. The readings were maximized by adjusting the antenna height between 1-4 meters, the turntable azimuth between 0-360°, and the antenna polarization. The frequency range 30MHz -1000MHz was scanned and the list of the highest emissions was verified and updated accordingly.

For measurements between 1GHz-10GHz:

The E.U.T was tested inside the shielded room and placed on a non-metallic table, 1.5 meters above the ground. The emissions were measured at a distance of 3 meters. The readings were maximized by the turntable azimuth between 0-360°, and the antenna polarization.

The frequency range 1GHz -10GHz was scanned.

The highest radiation is described in the tables below.

9.3 Test Limit

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)	Field strength* (dBµV/m)	Field strength* (dBµV/m)@3m
0.009-0.490	2400/F(kHz)	300	48.5-13.8	128.5-73.8
0.490-1.705	24000/F(kHz)	30	33.8-23.0	73.8-63.0
1.705-30.0	30	30	29.5	69.5
30-88	100	3	40.0	40.0

Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)	Field strength* (dB μ V/m)	Field strength* (dB μ V/m)@3m
88-216	150	3	43.5	43.5
216-960	200	3	46.0	46.0
Above 960	500	3	54.0	54.0

*The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector. For average radiated emission measurements above 1000 MHz, there is also a limit corresponding to 20 dB above the indicated values in the table is specified when measuring with peak detector function.

Figure 19 Table of Limits

9.4 Test Results

JUDGEMENT: Passed

For the operation frequency of 922.5 MHz, the margin between the emission level and the specification limit is in the worst case 2.3 dB at the frequency of 2709.0 MHz, vertical polarization.

The EUT met the requirements of the FCC Part 15, Subpart C Sections 15.209, 15.205, 15.247(d) specifications.

The details of the highest emissions are given in *Figure 20*.

10. Transmitted Power Density

10.1 Test Specification

FCC, Part 15, Subpart C, Section 247(e)

10.2 Test Procedure

(Temperature (20°C)/ Humidity (62%RH))

The E.U.T operation mode and test set-up are as described in Section 2 of this report. The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (total loss=31dB). Special attention was taken to prevent Spectrum Analyzer RF input overload.

Evaluation method performed according ANSI C63.10, Section 11.10.1: AVGPDS-1

10.3 Test Limit

For digitally modulated systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

10.4 Test Results

Protocol Type	Operation Frequency	Average Reading	Limit	Margin
	(MHz)	(dBm)	(dBm)	(dBm)
DTS	915.0	6.2	8.0	-1.8

Figure 22 Test Results

JUDGEMENT: Passed by-1 dB

For additional information see Figure 23.
