TYPE: GAT NET.Lock 7020 P / GAT NET.Lock 7020 USB P
DESCRIPTION: electronic locker locks for GAT NET.Lock 7020 controllers
SERIAL NO: 1913000001

The USB unit can be connected or disconnected. Therefore the Lock has the same serial number if a USB unit is connected or not. All measurement results refer to the equipment which was tested.

MEASUREMENT AND TEST SPECIFICATION

47 CFR Part 15, Subpart C, Intentional radiators, section 15.207 and section 15.225 /
RSS-210, Issue 9 and RSS-GEN, Issue 5

Test methods in:

ANSI C63.10-2013: American National Standard for Testing Unlicensed Wireless Devices.

No additions, deviations or exclusions have been made from standards and accreditation.

The test results detailed in this report apply only to the GAT NET.Lock 7020 P /
GAT NET.Lock 7020 USB P with the test setup described. Any modification such as a
change, addition to or inclusion of another device into this product will require an
additional evaluation.

The support equipment listed as part of the emission tests is required to properly exercise
and test the device under test.

SECTION 3

GENERAL INFORMATION

Possible test case verdicts:

	Temperature:	15 °C - 35 °C
	Humidity:	20 % - 60 %
	Atmospheric pressure:	900 mbar - 1000 mbar
Environmental conditions during testing:	If explicitly required by a basic standard the measured climatic conditions are documented in the corresponding test section.	

SECTION 4

SUMMARY OF TESTING

4.1 General annotation

The tests were performed in the order of the right column in the “Test Results – Overview” table.

At least at one emission test the margin to the limit is less than 3 dB. A minimum margin of 3 - 6 dB is recommended for a serial production.

4.2 Measurement uncertainty

For each test method, an uncertainty evaluation was carried out. The results of the evaluation can be provided upon request from Intertek Deutschland GmbH.

4.3 Omission of tests

The Frequency Stability Test is not required at the 125 kHz on-board RFID technology for FCC or ISCED. The Frequency Stability Test on the 13.56 MHz RFID antenna of the locks GAT NET.Lock 7020 P / GAT NET.Lock 7020 USB P were tested together with the different RFID readers inside of the controller types (GAT NET. Controller S 7020 F/ISO, ... ICLS and ... BA). These tests can be found in the appropriate test reports.

Description:			
The GAT NET.Lock 7020 lock is the ideal solution for the convenient electronic locking of lockers in leisure facilities, universities, company offices, and depot compartments. The identification of users at the GAT NET.Lock 7020 is carried out using contactless RFID data carriers and NFC technology. To use a locker, the user presses the locker door shut and holds their data carrier or NFC device near the reading field of the GAT NET.Lock 7020. The locking or usage status of the locker is signaled by an LED indicator. The various operating modes enable the flexible use of these locker locks. The "USB" version of the GAT NET.Lock 7020 is equipped with two USB ports to conveniently charge mobile devices.

1	Three locks were connected to the sub controller unit (sockets: 1, 12, 24)
2	One lock was connected to the controller

6.4 Operation mode

MODE	DESCRIPTION
	General: Pulse transmission with an interval of 250 ms. In 250 ms each lock was transmitting after each other first with 13.56 MHz and secondly with 125 kHz (at the lock versions with "P"). The locks are closed and locked. With a different card (other card number) it was tried to open the lock continuously with the card placed in front of the lock. This way the RFID part is transmitting continuously.
1	Pulse transmission (normal mode) with an interval of 250ms; 13.56 MHz Card; Comparison measurements between the 13.56 MHz tag card and the 125 kHz tag card in front of the lock showed the 13.56 MHz card to be the worst case situation. Therefore all measurements were done with the 13.56 MHz card. At the CE tests no difference between the card frequencies were detectable.

Comment

The conducted emission tests were performed in all different controller combinations according to the table in section 8 with the hereon following measurement diagrams (8.2).

In the conducted emission diagrams, the N and L line are merged.

The two additional controller were added to terminate the interfaces of the EUT for the EMC tests according to FCC, Part 15 B and is described in detail in the appropriate EMC test report.

Because the 125 kHz RFID frequency is outside the to be measured frequency range and no harmonics of the 125 kHz transmitter could be found, no worst case result was detectable.

7.2 Radiated emissions < 30 MHz

NORMATIVE REFERENCES			RESULT
Limits according to:	FCC §15.225 (d), §15.209 RSS-210, Issue 9, section B6		P

Limits

The limits below 30 MHz are given for different measurement distances. The limits below 30 MHz are converted to 3 m by using the extrapolation factor 40 dB/decade (according to §15.31).

Frequency (MHz)	Field strength (μV/m)	Field strength (dBμV/m)	Measurement distance (m)
0.009 - 0.490	2400/F(kHz)	67.6 - 20 · log(F(kHz))	300

1.705 - 13.110	30	29.5	30
14.010 - 30.000	30	29.5	30
Additionally, the level of any unwanted emissions shall not exceed the level of the fundamental emission.			

Test setup details

Compliance with the spectrum mask is tested using a spectrum analyzer with resolution bandwidth set to 10 kHz or 9 kHz CISPR. The video bandwidth shall be at least three times greater than the resolution bandwidth.

The test was carried out automatically by the test receiver.

The EUT is a table-top EUT and was standing on a table made of Styrodur with a Pertinax plate on top and the dimensions 1.6 m x 1.0 m x 0.8 m (Length x Width x Height).

The emission limits shown in the above table are based on measurements employing a CISPR quasi-peak detector except for the frequency bands 9-90 kHz, 110-490 kHz and above 1000 MHz. Radiated emission limits in these three bands are based on measurements employing an average detector.

Comment

The radiated emission tests < 30 MHz were performed in all different controller combinations according to the table in section 8 with the hereon following measurement diagrams (8.5).

The measurements with the worst case results is marked in the table in section 8.

Anechoic chamber

Test procedure

The test site is an anechoic chamber suitable for radiated emission measurements in the frequency range of 9 kHz – 30 MHz. It includes automatic turntable of radius 2 m. It enables manual and fully automatic measurements.

To find the highest level of radiation

- the height of the antenna is 1m with antenna in horizontal and vertical polarization;
- the turntable is rotated in range from 0° to 360°.

The system was configured for testing in a typical worst case fashion (as a customer may use it). All interface cables were moved to determine the position which resulted in the highest emission levels.

Correction factors

The field strength is calculated by adding the antenna factor and cable attenuation.

The calculations are performed automatically by the measurement software EMC 32.

As example consider the following input values and result:

FREQUENCY (MHZ)	RECEIVER READING U (dBμV)	ANTENNA FACTOR AF (dB/m)	CABLE ATTENUATION A (dB)	CORRECTION ANTENNA + CABLE (dB)	RADIATED FIELD STRENGTH E (dBμV/m)

Comment

The radiated emission test from 30 MHz to 1 GHz was performed in all different controller combinations as peak pre-measurements according to the table in section 8 with the hereon following measurement diagrams (8.6).

Because the 125 kHz RFID frequency is outside the to be measured frequency range and no harmonics of the 125 kHz transmitter could be found, no worst case result was detectable.

Anechoic chamber

Test procedure

The test site is an anechoic chamber suitable for radiated emission measurements in the frequency range of 30 MHz – 18 GHz (40 GHz). It includes automatic antenna mast of height 4 m and turntable of radius 2 m. It enables both manual and fully automatic measurements. To find the highest level of radiation

- the height of the antenna is scanned in range 1m to 4 m with antenna in horizontal and vertical polarization;
- the turntable is rotated in range from 0° to 360°.

The system was configured for testing in a typical worst case fashion (as a customer may use it). All interface cables were moved to determine the position which resulted in the highest emission levels.

Because it is a Pre-test this measurement was done with Pk detector.
The limit is for QP, therefore it's not relevant if the Pk values are over
the limit line in this diagram.

SECTION 9

MEASUREMENT UNCERTAINTY EVALUATION

Measurement uncertainty for radiated magnetic field, 9 kHz – 30 MHz	± 3.2 dB
Measurement uncertainty for radiated emission, 30 MHz - 1000 MHz	
Uncertainty for the frequency range 30 to 300 MHz using a biconical or a combination antenna at 3 m	± 4.9 dB
Uncertainty for the frequency range 300 to 1000 MHz using a logperiodic or a combination antenna at 3 m	± 4.7 dB
Measurement uncertainty for radiated emission 1 to 26 GHz	
Uncertainty for the frequency range 1 to 18 GHz	± 6.1 dB
Uncertainty for the frequency range 18 to 26,5 GHz	± 6.5 dB
Measurement uncertainty for conducted disturbances at the antenna port on radio equipment	
Frequency range 9 kHz - 1 GHz	± 1.9 dB
Frequency range 1 GHz - 18 GHz	± 3.0 dB
Frequency range 18 GHz -26,5 GHz	± 3.6 dB
Measurement uncertainty for Frequency error	± 1 x 10 ⁻⁸
Measurement uncertainty for Output power (Conducted), 9 kHz - 18 GHz	± 1.0 dB
Measurement uncertainty for RF Power density	
Frequency range 9 kHz - 1 GHz	± 1.9 dB
Frequency range 1 GHz - 18 GHz	± 3.0 dB
Frequency range 18 GHz -26,5 GHz	± 3.6 dB
Measurement uncertainty for humidity	± 4 %
Measurement uncertainty for temperature	± 0.5 °C
Measurement uncertainty for voltage	
DC	± 0.1 %
AC up to 10 kHz	± 1.8 %
Measurement uncertainty for time	± 0.058 %
Measurement uncertainty for conducted emissions, LISN, 150 kHz -30 MHz	± 2.3 dB
Measurement uncertainty for OBW	± 4.3 %
601 points resolution (Spectrum analyzer)	± 0.83 %
30000 points resolution (Spectrum analyzer)	± 0.016 %
