2. Test Configuration of Equipment under Test

2.1. Test Manner

- a. The EUT has been tested pursuant to ANSI C63.4-1992 and configuration operated in a manner which tended to maximize its emission characteristics in a typical application.
- b. A receiver, which is designed to be used for EUT when marketed, was used during testing.
- c. The GAIN Receiver was to used for EMI test.
- d. Frequency range investigated: conduction 450 KHz to 30 MHz, radiation 30 MHz to 4,330 MHz.
- e. The radiated emissions testing was made by rotating three orthogonal axes.(Normal mode, Horizontal mode, Vertical mode).
- f. The operation frequency of the EUT may be set from 433.05 to 434.79MHz. But each equipment will be set to only a fixed frequency, such as 433.1MHz, or 434.5MHz, not a frequency range. The actual operation frequency of these two EUTs are 433.088MHz and 434.78MHz.
- g. The EUT employs a switch that will automatically deactivate the transmitter within no more than 5 seconds of being relased.
- h. The EUT has no periodic transmission at regular predetermined interval.
- i. Pursuant to 15.231(c) of Part 15. Subpart C, the bandwidth of the emission at the 20dB point shall be no wider than 0.25% of the center frequency for EUT.

The carrier frequency of EUT is 433MHz and 434.78MHz
 $433\text{MHz} * 0.25\% = 1082.5\text{KHz}$. $434.78\text{MHz} * 0.25\% = 1086.95\text{KHz}$.

For 433.08MHz, the bandwidth is 325KHz (as shown in section 2.4.1 of this test report), which is less than 1082.7KHz.

For 434.78MHz, the bandwidth is 596KHz (as shown in section 2.4.2 of this test report), which is less than 1086.95KHz;

The EUT meet the 20dB point bandwidth requirement.

2.2. Description of Test System

Support Unit 1. -- Receiver (GAIN)

6. Test of Radiated Emission

Radiated emissions from 30 MHz to 4,348 MHz were measured with a bandwidth of 120 kHz according to the methods defines in ANSI C63.4-1992. The EUT was placed on a nonmetallic stand in the open-field site, 0.8 meter above the ground plane, as shown in section 6.3. The interface cables and equipment positions were varied within limits of reasonable applications to determine the positions producing maximum radiated emissions.
