Section 1. Summary Of Test Results

General

All measurements are traceable to national standards.

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 15, Subpart C, Paragraph 15.247 for Direct Sequence Spread Spectrum devices.

Section 4. Peak Power Output**Para. No.: 15.247(b)**

Test Performed By: Wayne Clarke	Date of Test: April 23, 2001
--	-------------------------------------

Test Results: Complies. The maximum peak power output of the transmitter is 18.7dBm.

Measurement Data: Detachable antenna? ☒ Yes ☐ No

If yes, state the type of non-standard connector used at the antenna port: Reverse TNC Connector.

Antenna Gain is 8dBi.

Section 6. Spurious Emissions (Radiated)

Para. No.: 15.247(c)

Test Performed By: Wayne Clarke	Date of Test: April 18, 2001
--	-------------------------------------

Test Results: Complies. The worst-case emission level is 50.1 dB μ V/m @ 3m at 4824.384MHz. This is 3.9dB below the specification limit.

Measurement Data: See attached graphs.

The spectrum was searched up to the 10th harmonic of the fundamental frequency of operation.

Each actual burst cycle also includes two guard times to allow for both propagation and RF transceiver switching time. More specifically, G1 is a 32-bit delay between the time when the master stops transmission and the slave commences transmission; G2 is a 32-bit delay between the time when the slave stops transmission and the master commences transmission as shown in Figure 4. These guard times allow for a 375 μ s delay. The total burst cycle is 768 bits long, including 12 bits internal delay (transmitter turns off 6 bits after the last data bit is latched into the transmitter, the master and slave therefore contribute a total of 12-bit internal delay).

Figure 5: Master/Slave Frame Relationship

4.2 Direct Sequence Spread Spectrum

Transceiver logic spreads the 85.33 kbps data frames with a chip rate of 1.365 Mbps to achieve a process gain of approximately 11.5 dB. Consecutive data frame bit-pairs are encoded as one of four symbols each with a unique 32-bit PN sequence. Data is further randomized by modulus-2 addition with a 2047-bit PN sequence. This operation smoothes the output spectrum of the transmitted signal and eliminates discrete spectral components.

Each of eight channels corresponds to a unique set of four PN sequences. All PN sequences are listed in Table 1.

Transmitter Power Density & Peak Power At Antenna Terminals

If the EUT has an integral (non-detachable) antenna, the above test is performed as a radiated measurement and the result is reported as EIRP.

Processing Gain

NOTE: This is a typical setup. The setup may vary slightly since many devices have BER test functions built into the device.
