AMPLIFIER INTERMODULATION SPURIOUS EMISSIONS – CONDUCTED – PART 2.1053– UPLINK

Ambient temperature = 26°C
Relative humidity = 53%
Supply voltage = +110Vac

Radio Laboratory

The Intermodulation and spurious products were measured with the amplifier operating at maximum gain. A three tone test was conducted using the equipment as above. The input power level was adjusted so the level at point D was 10dB above the maximum input of –75dBm. The cable and attenuator loss between the EUT and the spectrum analyser was 26.89dB. The Uplink input is split into two frequency ranges, 153.75-155.3MHz and 159-161MHz. This test was performed with 3 carriers on the frequencies listed in the table below. Sweep data is shown on the next pages for scan with the highest intermodulation product.

Radio Laboratory

This test was performed to show that the amplifier does not alter the input signal in any way. The input signal was set to the maximum input level (-75dBm) and modulated with a 2500Hz tone. The plots show the signal measured at the signal generator without any attenuators in line and the signal measured at the output of the EUT.

Note: The cables and attenuators had the following losses.

1. Cable and attenuators between EUT and spectrum analyser 26.89dB
2. Cable between signal generator and EUT 0.47dB

Cable and attenuator between EUT and spectrum analyser removed to show signal measured at the signal generator.

The test was set up as per the diagram. The level at the input was adjusted to compensate for the loss of the interconnecting cable. The unit was tested operating at maximum power and on five test frequencies.

The Spurious limit was calculated as follows:

On any frequency removed from the assigned frequency by more than 250% of the authorised bandwidth

At least $43 + 10 \log P_{dB}$

$$(10 \log P_{\text{watts}}) - (43 + 10 \log (P_{\text{watts}} * 1000)) = \text{LIMIT} = -13 \text{ dBm}$$
