

Dear Timothy,

Here are our answers:

1. We have updated P89 to P97 of the report
- 2.

Ans : Data transmission is always initiated by software, which is then passed through the MAC, through the digital and analog baseband, and finally to the RF chip. Several special packets (ACKs, CTS, PSpoll, etc...) are initiated by the MAC. These are the only ways by which the digital baseband portion will turn on the RF transmitter, which it then turns off at the end of the packet. Therefore, the transmitter will be on only while one of the aforementioned packets is being transmitted."

Please review the information we supplied. If there is any information needed, please advise as soon as possible.

Thanks for your help.
