1.0 General Information:

This report has been prepared on behalf of **Young Design, Inc.**, to support the attached Application for a Certification of a Part 15 Spread Spectrum Transmitter. The Equipment Under Test (EUT) was the **Model: Lucent/Agere WaveLAN Card with Model AMP2440-XXF Amplifier**. The EUT configuration consisted of an Omni directional antenna, one twelve volt AC-DC power supply, and 50 ohm low loss cable. The test results reported in this document relate only to the item that was tested.

Radio-Noise Emissions tests were performed according to **FCC Public Notice 54797, titled "Guidance on Measurement for Direct Sequence SST"**. The measuring equipment conforms to ANSI C63.2 Specifications for Electromagnetic Noise and Field Strength Instrumentation.

1.1 Summary:

The Young Design, Inc., **Lucent/Agere WaveLAN Card with Model AMP2440-XXF Amplifier**, and a suite of specific antennas complies with the FCC limits (15.247) for a Direct Sequence SST. Tests were performed on radio channels 1, 6, and 11. These are referred to in the report as the low, mid and high channels respectively.

1.2 Test Methodology:

Both conducted and radiated testing were performed according to the procedures in ANSI C63.4 1992. Radiated testing was performed at an antenna to EUT distance of three (3) meters.

1.3 Test Facility:

The open area test site and conducted measurement facility used to collect the radiated data is located on the parking lot of National Certification Laboratory 8370 Court Avenue, Suite B-1, Ellicott City, Maryland 21043. This site has been fully described in a report dated May 26, 1993, submitted to and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing.

2.0 Description of Equipment Under Test (EUT):

The **Lucent Agere WaveLAN Card** is currently certified with FCCID: **IMRWLPCE24H**. Young Design, Inc. has not modified this product in any manner except for the addition of high gain antennas, and an external amplifier.

Professional Installation Requirement:

The amplifier unit incorporates a standard N connector to the antenna, therefore requiring professional installation. The User Manual specifies that only trained certified technicians should install the **AMP2440-xxF Amplifier**. There are many technical steps needed to install an operating system as outlined in the manual. These include antenna support structure, site survey, antenna alignment, test, and troubleshoot. All systems sold to businesses are installed under the supervision of Young Design, Inc. Marketing is limited to sales by authorized dealers.

The EUT features:

Direct Sequence Spread Spectrum Modulation

24 dBm Peak RF Output

2412 to 2462 MHz Frequency Range

10 MHz, 6 dB Emission Bandwidth

11 Available Channels

5 MHz Channel Separation

11 Mbps Data Rate (Radio Link)

2.1 EMI Countermeasure:

The following modifications were made to the EUT, by the project engineer to assure compliance to specifications:

None.

3.0 Test Program:

This report contains measurement charts and data as evidence for the following tests performed:

1. (15.247b) Peak RF output power.
2. (15.247a) 6 dB Emission Bandwidth.
3. (15.247c) RF Antenna Conducted output of harmonics and spurious out-of-band emissions.
4. (15.247c) Field Strength of harmonics and spurious out-of-band emissions.
5. (15.207) AC Power Line Conducted emissions.
6. (15.247c) Band Edge emissions.
7. (15.247d) Power Spectral Density.

4.0 Test Configuration for Antenna Terminal Conducted:

The PCM wireless LAN card was installed in a notebook computer for testing. A DOS program is used to control the transmitter. The external amplifier is connected in-line between the wireless LAN card and antenna via 50 feet of 3/8 inch low-loss cable. This has insertion loss of 3.3 dB at 2450 MHz. The Installation Manual will specify that the coax cable between the D.C. Injector and amplifier must have at least 3.3dB loss if other than 3/8 inch low-loss cable is used. The 50 foot cable is the minimum length of 3/8 inch cable to be supplied with the system.

RF power output measurements were taken with a Peak RF power meter at the amplifier antenna connector. RF antenna conducted output tests such as Bandwidth, Spurious/Harmonics, and Power Spectral Density were taken with the amplifier antenna connector feeding directly into the spectrum analyzer via external 30 dB attenuator. The analyzer's internal attenuator was adjusted to prevent overloading of the front end. All four data bit-rates were checked to determine if variations in Power, Bandwidth, Bandedge, and Power Spectral Density levels were measured. The worse-case data rate was 11 Mbps, thus charts and tables given in this report, reflect this mode.

Field strength measurements were taken both with the amplifier in-line, and subsequently with just the wireless LAN card feeding a grid dish, panel, or omni antenna aimed at the receiving antenna. Testing was performed using the highest gain antenna from each design family (grid, panel, omni) in order to cover the worst case range of combinations.

A list of all antennas and suggested cables that will be sold with the EUT is provided in Table 1.

4.1 Peak Power Test Results:

Limit: 1 watt (30 dBm)

Condition: Transmitter is set to a single 11 Mbps modulated channel at full power.
Measurements taken at amplifier antenna connector.

Readings from Peak Power Meter:

WLAN Card w/ AMP @ 2412 MHz: **23.9 dBm**

WLAN Card w/ AMP @ 2437 MHz: **24.0 dBm**

WLAN Card w/ AMP @ 2462 MHz: **23.8 dBm**

4.2 6 dB Emission Bandwidth Test Results:

Minimum 6 dB BW: 0.500 MHz
RBW Setting on S.A.: 100 kHz

Condition: Transmitter is set to a single 11 Mbps modulated channel at full power.
Measurements taken at amplifier antenna connector.

Readings from Spectrum Analyzer:

WLAN Card w/ AMP @ 2412 MHz:	10.6 MHz
WLAN Card w/ AMP @ 2437 MHz:	10.6 MHz
WLAN Card w/ AMP @ 2462 MHz:	10.4 MHz

4.3 RF Antenna Conducted Spurious/Harmonics Emissions:

Limit: 20 dB below Carrier Level Measured with 100 kHz RBW
RBW Setting on S.A.: 100 kHz

Condition: Transmitter is set to a single 11 Mbps modulated channel at full power.
Measurements taken at amplifier antenna connector

Three separate measurements are performed to show harmonic and spurious emissions generated with the transmitter tuned to low, middle, and high parts of the spectral range.

5.0 Test Configuration for Conducted and Radiated Emissions:

The EUT was set up on the center of the test table, in a manner which follows the general guidelines of ANSI C63.4, Section 6 **“General Operating Conditions and Configurations”**. Two sets of measurements were taken: First set with amplifier, second set without amplifier.

This is described below:

6.0 A.C. Conducted Emissions Scheme:

The EUT is placed on an 80 cm high 1 X 1.5 m non-conductive table. Power to the RF amplifier is provided through a Solar Corporation 50 Ω / 50 μ H Line Impedance Stabilization Network bonded to a 2.2 X 2 meter horizontal ground plane, and a 2.2 X 2 meter vertical ground plane. The LISN has its AC input supplied from a filtered AC power source. A separate LISN provides AC power to the peripheral equipment. I/O cables are moved about to obtain maximum emissions.

The 50 Ω output of the LISN is connected to the input of the spectrum analyzer and emissions in the frequency range of 450 kHz to 30 MHz are searched. The detector function is set to Quasi-Peak and the resolution bandwidth is set at 9 kHz, with all post detector filtering no less than 10 times the resolution bandwidth for final measurements. All emissions within 20 dB of the limit are recorded in the data tables.

7.0 Radiated Emissions Scheme:

The EUT is placed on an 80 cm high 1 X 1.5 meter non-conductive motorized turntable for radiated testing on the 3 meter open area test site. The emissions from the EUT are measured continuously at every azimuth by rotating the turntable. Guided horn and log periodic broadband antennas are mounted on an antenna mast to determine the height of the maximum emissions. The heights of the antennas are varied between 1 and 4 meters. Both the horizontal and vertical field components are measured.

The RF spectrum is searched from 30 MHz to 9.28 GHz.

The output from the antenna is connected to the input of the preamplifier. The pre-amp out is connected to the spectrum analyzer. The detector function is set to PEAK. The resolution bandwidth of the spectrum analyzer is set at 120 kHz for the frequency range of 30-1000 MHz, and 1 MHz for the frequency range of 1-9 GHz. A 10Hz video BW setting is used to average readings above 1 GHz when applicable. All emissions within 20 dB of the limit are recorded in the data tables.

To convert the spectrum analyzer reading into a quantified E-field level to allow comparison with the FCC limits, it is necessary to account for various calibration factors. These factors include cable loss (CL) and antenna factors (AF). The AF/CL in dB/m is algebraically added to the Spectrum Analyzer Voltage in dBμV/m. This level is then compared to the FCC limit.

EXAMPLE

Spectrum Analyzer Voltage:	VdBmV
Composite Factor:	AF/CL dB/m
Electric Field:	E dBmV/m = V dBmV + AF/CL dB/m
Linear Conversion:	E mV/m = Antilog (E dBmV/m /20)

8.0 RF Exposure Statement:

Notice in Installation Manual:

FCC Radiation Exposure Statement

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment when installed as directed. This equipment should be installed and operated with fix-mounted antennas that are installed with a minimum of 2 meters of separation distance between the antenna and all persons' body during normal operation.

RF Exposure Calculations:

The following information provides the **minimum** separation distance for the highest gain antenna provided with the **Lucent Agere WaveLAN Card with Model AMP2440-RxF Amplifier**, as calculated from **FCC OET 65 Appendix B, Table 1B** Guidelines for General Population/Uncontrolled Exposure. This calculation is based on the highest EIRP possible from the system, considering maximum power and antenna gain, and considering a 1.0 mW/cm² uncontrolled exposure limit. The Friss formula used was:

$$S = (P_o * G) / (4 * \pi * r^2) \quad \text{or} \quad r = \sqrt{(P_o * G) / (4 * \pi * S)}$$

Where S = 1.0 mW/cm² for 2400 MHz

Where P_o = 250 mW (Peak RF)

Where G = Isotropic antenna gain (numeric)

Where r = Minimum Safe Distance from antenna (cm)

For: 24 dBi Grid Dish Antenna - Lucent or YDI models r = 71 cm

Notes:

1. MPE distance figures are based on a conservative “worse case” prediction, i.e. +24 dBm into antenna and using formula $S = EIRP / (4\pi R^2)$ and no calculation for duty factor. In practice the minimum distance will be much shorter. (Ref. 2)
2. The minimum MPE distance has been calculated for the maximum allowed Power Density (S) limit of 1.0 mW/cm² in the Frequency range 1500-100,000 MHz for uncontrolled environments (Ref. 2).

Reference:

1. FCC Part 15, sub-clause 15.247 (b) (4)
2. FCC OET Bulletin 65, Edition 97-01
3. FCC Supplement C to OET Bulletin 65, edition 97-01

CAUTION: If the power output of the amplifier exceeds +24 dBm or antennas in excess of 24 dBi gain are used, then the Effective Radiated Power limits specified in FCC rules 15.247(b)(3)(i) could be exceeded.
