FCC §2.1051 & §90.210 & §90.219(d),(e)(2),(e)(3) - SPURIOUS EMISSIONS AT ANTENNA TERMINALS

Applicable Standard

The spectrum shall be investigated to the tenth harmonics of the highest fundamental frequency as specified in § 2.1057

Out of band emissions:

Attenuated below the transmitting power (P) by a factor of at least $43 + 10\log(P)$ dB, or -13 dBm.

Good engineering practice must be used in regard to the radiation of intermodulation products and noise, such that interference to licensed communications systems is avoided. In the event of harmful interference caused by any given deployment, the FCC may require additional attenuation or filtering of the emissions and/or noise from signal boosters or signal booster systems, as necessary to eliminate the interference.

In general, the ERP of intermodulation products should not exceed -30 dBm in 10 kHz measurement bandwidth.

The noise figure of a signal booster must not exceed 9 dB in either direction.

Uplink measurements only required. Uplink signal is received from booster/repeater antenna “over the air”. Downlink signal is NOT “over the air” fed but hardwired via licensed operator basestation which the noise floor is well below -100 dBm/Hz (See Plot Below)

Spurious emissions from a signal booster must not exceed -13 dBm within any 100 kHz measurement bandwidth.

Test Procedure

The RF output of the EUT was connected to a spectrum analyzer through appropriate attenuation. The resolution bandwidth of the spectrum analyzer was set at 100 kHz for below 1GHz, and 1MHz for above 1GHz. sufficient scans were taken to show any out of band emissions up to 10th harmonic.

FCC §2.1053 & §90.669 - RADIATED SPURIOUS EMISSIONS

Applicable Standard

FCC §2.1053 and §90.669

Test Procedure

The transmitter was placed on a wooden turntable, and it was transmitting into a non-radiating load, which was also placed on the turntable.

The measurement antenna was placed at a distance of 3 meters from the EUT. During the tests, the antenna height and polarization as well as EUT azimuth were varied in order to identify the maximum level of emissions from the EUT. The test was performed by placing the EUT on 3-orthogonal axis.

The frequency range up to tenth harmonic of the fundamental frequency was investigated.

Remove the EUT and replace it with substitution antenna. A signal generator was connected to the substitution antenna by a non-radiating cable. The absolute levels of the spurious emissions were measured by the substitution.

Spurious emissions in dB = 10 lg (TXpwr in Watts/0.001)-the absolute level

Spurious attenuation limit in dB = 43 + 10 Log₁₀ (power out in Watts)
