Dennis,

1. The Field Programming Software is used to program limited radio parameters such as power output level, operating frequency, PTT Watchdog Timeout, PTT and Carrier Detect Polarity and etc. The Field Programming Software does not define the construction of the actual modulation waveforms transmitted or the deconstruction of the modulation waveforms received. The TSLM is not a Software Defined Radio.
2. The device is typically hooked to a computer during factory test and tune operations and is not hooked to a computer in normal operation. We have tested the device to the FCC Part 15.33, 15.109 and 15.111.

Regards,

Bill Junge
