ELECTROMAGNETIC EMISSIONS TEST REPORT

according to 47CFR Part 90, subpart I and part 15, subpart B
for

Telematics Wireless Ltd.

EQUIPMENT UNDER TEST:

Hand held reader

Model:FP100HH

This report is in conformity with ISO/IEC 17025. The A2LA logo endorsement applies only to the test methods and the standards that are listed in the scope of Hermon Laboratories accreditation.

The test results relate only to the items tested. **This test report must not be reproduced in any form except in full with the approval of Hermon Laboratories Ltd.**

1 Project information

Equipment under test information

Test items	: Hand held reader
Manufacturer	: Telematics Wireless Ltd.
Types (Models)	: FP100HH
Serial number	: 2139-32011-00 rev.F
Software revision	: 2.00

Applicant information

Applicant's responsible person	: Mr. Roman Sternberg, VP marketing
Company	: Telematics Wireless Ltd.
Address	: 26, Hamelacha street
P.O.Box	: 1911
City	: Holon
Postal code	: 58117
Country	: Israel
Telephone number	: +972-3557 5750
Telefax number	: +972-3557 5753

Test details

Project number:	: 15852
Location	: Hermon Laboratories
Test started	: March 15, 2004
Test completed	: March 21, 2004
Purpose of test	: Apparatus compliance verification in accordance with emission requirements
Test specification(s)	: 47CFR part 90, §§90.205, 90.209, 90.210, 90.213, part 15 §15.107, §15.109

2 Summary and signatures

The EUT, FP100HH reader, was tested according to FCC part 90 subpart I, §§90.205(k), 90.209, 90.210(k)(3), part 15 §§15.107, 15.109 and found to comply with the standard requirements.

Test description	Specification reference	Tested by	Date tested	Test report paragraph	Verdict
RF output power	90.205(k); 2.1046	Mr. Y. Neuman, test engineer	March 15, 2004	4.1	Pass
Occupied bandwidth	90.209; 2.1049	Mr. Y. Neuman, test engineer	March 16, 2004	4.2	Pass
Emission mask	90.210(k)(3); 2.1051	Mr. Y. Neuman, test engineer	March 16, 2004	4.3	Pass
Radiated spurious emissions	90.210; 2.1053	Mr. Y. Neuman, test engineer	March 16, 2004	4.3	Pass
Radiated emissions	15.109	Mr. Y. Neuman, test engineer	March 16, 2004	4.4	Pass
Frequency stability	90.213, 2.1055	Mr. Y. Neuman, test engineer	March 21, 2004	4.5	Tested
Conducted emissions	15.107	Mr. B. Efros, test engineer	March 17, 2004	4.6	Pass

Test report prepared by:

Mrs. M. Cherniavsky, MScEE, certification engineer

Test report approved by:

Mr. Michael Nikishin, MScEE, group leader

Mr. Edward Usoskin, PhD, C.E.O.

3 EUT description

3.1 General description

The EUT, a hand held reader with a pocket PC, is a part of electronic seal monitoring system, operating at 915 MHz with ASK modulation and utilizing 2.0 dBi integral antenna. Data bit rate is 500 kbps. The device is powered from internal rechargeable battery.

The frequencies generated or used in the EUT are: 8 MHz, 16 MHz (reference clock), 204.6 MHz (PC pocket CPU).

3.1.1 Changes made in the EUT

To withstand the FCC part 15 subpart B requirements the ferrite bead, P/N 0444164281, manufactured by Fair-Rite, was installed on the DC output cable inside the charger.

3.2 EUT test configuration

The EUT ports and lines description is given in Table 3.2.1, support/test equipment list is provided in Table 3.2.2, test configuration is shown in Figure 3.2.1.

Table 3.2.1
EUT ports and lines

4 Test results

4.1 Peak output power test according to part 90 §90.205(k)

DATE of TEST: March 15, 2004
AMBIENT TEMPERATURE: 20°C
RELATIVE HUMIDITY: 43 %
AIR PRESSURE: 1020 hPa
MEASUREMENT UNCERTAINTY: ±4.5 dB

Frequency, MHz	Field strength, dB(μV/m)	RF generator output, dBm	Antenna gain, dBd	Cable loss, dB	Peak output power, dBm	Limit, dBm	Verdict	Reference to plot in Annex 1
914.904	111.50	15.7	0.4	1.8 + 0.5	13	44.7	Pass	A1

ERP = $P_{\text{gen}} - CL + G_{\text{ant}} = 15.7 \text{ dBm} - 1.8 \text{ dB} - 0.5 \text{ dB} - 0.4 \text{ dBd} = 13.0 \text{ dBm} = 20 \text{ mW}$

LIMITATION ON POWER

Operating frequency range, MHz	Maximum effective radiated power (ERP)
902 - 927.25	30 W (44.7 dBm)

TEST PROCEDURE

The EUT was set up on the 80 cm height wooden table as shown in Figure 4.2.1. Field strength of fundamental was measured at 3-m test distance in the anechoic chamber the biconilog antenna, test results was recorded in plot A1. The test equipment was set up as shown in Figure 4.2.2 for substitution method.

The EUT was replaced with a substitution antenna connected to signal generator. The measuring antenna height was changed from 1 to 4 m to find a maximum radiation from substitution antenna. The level of the signal generator output was adjusted to produce the same field strength as was measured from the EUT. The above procedure was performed in both, horizontal and vertical, polarizations of the test and substitution antennas.

$$\text{ERP (dBm)} = P_{\text{out gen}} (\text{dBm}) - \text{cable loss (dB)} + \text{antenna gain (dBd)}$$

LIMIT

Operating frequency range, MHz	Authorized bandwidth, MHz
909.75 – 921.75	12

TEST PROCEDURE

The EUT was setup as shown in Figure 4.2.1. The measurements were performed in continuous transmit mode of operation at frequencies between 26 dBc points.

TEST EQUIPMENT USED:

HL 0465	HL 0521	HL 0589	HL 0592	HL 0593	HL 0594	HL 0604
HL 1004	HL 2009					

4.3 Emission mask and radiated spurious emissions test according to part 90 §90.210(k)(3)

METHOD OF MEASUREMENTS	ANSI 63.4 §13.1.4
DATE of TEST:	March 16, 22, 2004
AMBIENT TEMPERATURE:	25°C
RELATIVE HUMIDITY:	32 %
AIR PRESSURE:	1020 hPa
FREQUENCY RANGE:	9 kHz – 9.2 GHz
MEASUREMENT UNCERTAINTY:	±4.5 dB

The peak power of any emission shall be attenuated below the power of the highest emission contained within the licensee's sub-band in accordance with the following schedule:

- 1) On any frequency within the authorized bandwidth: zero dB;
- 2) On any frequency outside the licensee's sub-band edges: $55 + 10 \log (P)$ dB, where (P) is the highest emission (in watts) of the transmitter inside the licensee's sub-band.

4.3.1 Test procedure

Radiated spurious emissions were measured at 3-m test distance in the anechoic chamber from 9 kHz up to 6.5 GHz and at OATS from 6.5 GHz up to 9.2 GHz:
with the loop antenna in the 9 kHz to 30 MHz range,
the biconilog - in the 30 MHz to 1000 MHz range,
the double ridged guide – in the 1 GHz to 9.2 GHz range.
The EUT was set up on the 80 cm height wooden table as shown in Figures 4.3.1 and 4.3.2.

9 kHz – 30 MHz frequency range. The loop antenna was positioned with its plane vertical. The loop center was 1 meter above the ground plane. To find maximum radiation the turntable was rotated 360 and the measuring antenna was rotated about its vertical axis.

30 MHz – 9.2 GHz frequency range. To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.

The specified limit $55 + 10 \log (P)$ was converted in 72.4 dB(μV/m) equivalent field strength at 3 m:

$E = \sqrt{30P \times 1.64} / r$, where

$P = -25 \text{ dBm} = 3.16 \times 10^{-6} \text{ W}$, 1.64 is a numeric gain of an ideal dipole, r - 3 meter distance.

$E [\text{dB}\mu\text{V/m}] = 20 \log \{10^6 \times \sqrt{30 \times 3 \times 10^{-6} \times 1.64} / 3\} = 72.4 \text{ dB}\mu\text{V/m}$.

This limit was applied to spurious emissions testing in transmit mode throughout the following frequency ranges:

9 kHz to 909.75 MHz and 921.75 MHz to 9.2 GHz. The test results were recorded in Table 4.3.1 and shown in Plots A4 to A30.

The test equipment was set up as shown in Figures 4.3.3. The found spurious emissions were retested by substitution method.

The EUT was replaced with a substitution antenna (double ridge guide for the mentioned range) connected to signal generator. The measuring antenna height was changed from 1 to 4 m to find a maximum radiation from substitution antenna. The level of the signal generator output was adjusted to produce the same field strength as was measured from the EUT and depicted in Tables 4.3.1, 4.3.2 The above procedure was performed in both, horizontal and vertical, polarizations of the test and substitution antennas.

$$\text{ERP (dBm)} = P_{\text{out gen}} (\text{dBm}) - \text{cable loss (dB)} + \text{antenna gain (dBd)}$$

4.5 Frequency stability measurement according to §90.213

DATE of TEST:	March 21, 2004
AMBIENT TEMPERATURE:	24°C
RELATIVE HUMIDITY:	48 %
AIR PRESSURE:	1020 hPa
OPERATING FREQUENCY:	915 MHz
NOMINAL POWER VOLTAGE:	4.8 V DC
POWER DURING TEMPERATURE TRANSITION:	Off
SPECTRUM ANALYZER MODE:	Counter
RESOLUTION BANDWIDTH:	1 kHz
VIDEO BANDWIDTH:	1 kHz
MODULATION:	Unmodulated

TEST PROCEDURE

This test was performed to measure frequency stability of transmitter RF carrier. The EUT was set up as shown in Figure 4.5.1, energized and its proper operation was checked. The EUT power was turned off. Temperature within test chamber was set to +30°C and a period of time sufficient to stabilize all of the oscillator circuit components was allowed. The EUT was powered on and carrier frequency was measured at start up moment and then every minute until frequency had been stabilized or 10 minutes elapsed whichever reached the last. The EUT was powered off. The above procedure was repeated at 0°C and at the lowest test temperature. The EUT was powered on and carrier frequency was measured at start up moment and at the end of stabilization period at the rest of test temperatures and voltages. The EUT was powered off. Frequency displacement was calculated and compared with the limit as provided in Table 4.5.1.

TEST PROCEDURE

The measurements were performed at mains terminals by means of LISN, connected to spectrum analyzer in the frequency range as referred to in the table above. The unused coaxial connector of the LISN was terminated with 50 Ω . The measurements were made with quasi-peak and average detectors as referred to in the tables. The position of the EUT cables was varied to determine maximum emission level.

Appendix D General information

Test facility description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private, EMC, safety, environmental and telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, telecommunications, environmental, safety standards, and by AMTAC (UK) for safety of medical devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for electromagnetic compatibility, product safety, telecommunications testing and environmental simulation (for exact scope please refer to Certificate No. 839.01) and approved by Israel Ministry of environmental protection, radiation hazards department (Permit number 1158).

Address: PO Box 23, Binyamina 30500, Israel.

Telephone: +972 4628 8001

Fax: +972 4628 8277

e-mail: mail@hermonlabs.com

website: www.hermonlabs.com

Person for contact: Mr. Alex Usoskin, QA manager.

Abbreviations and acronyms

The following abbreviations and acronyms are applicable to this test report:

ASK	amplitude shift keying
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
EUT	equipment under test
GHz	gigahertz
H	height
Hz	hertz
kHz	kilohertz
kV	kilovolt
L	length
LNA	low noise amplifier
LMS	location and monitoring service
LO	local oscillator
m	meter
MHz	megahertz
NA	not applicable
QP	quasi-peak
RF	radio frequency
Rx	receiver
rms	root mean square
s	second
Tx	transmitter
V	volt
W	width
