- (b) Except as provided in paragraph (d) and (e), the field strength of emissions appearing within these frequency bands shall not exceed the limits shown in Section 15.209 shall be demonstrated using measurements instrumentation employing a CISPR quasi-peak detector. Above 1000 MHz, compliance with the emission limits in Section 15.209 shall be demonstrated based on the average value of the measured emissions. The provisions in Section 15.35 apply to these measurements.
- (c) Except as provided in paragraphs (d) and (e), regardless of the field strength limits specified elsewhere in this Subpart, provisions of this Section apply to emissions from any intentional radiator.
- (d) The following devices are exempt from the requirements of this Section:
1. Swept frequency field disturbance sensors operating between 1.705 and 37 MHz provided their emissions only sweep through the band listed in paragraph (a), the sweep is never stopped with the fundamental emission within the bands listed in paragraph (a), and the fundamental emission is outside of the bands listed in paragraph (a) more than 99% of the time the device is actively transmitting, without compensation for duty cycle.
 2. Transmitters used to detect buried electronic markers at 101.4 kHz which are employed by telephone companies.
 3. Cable locating equipment operated pursuant to Section 15.213.
 4. Any equipment operated under the provisions of Section 15.253 or Section 15.255 of this Part.
 5. Biomedical telemetry devices operation under the provisions of Section 15.242 of this part are not subject to the restricted band 608-614 MHz but are subject to compliance with the other restricted bands.
 6. Transmitters operating under the provisions of Subpart D or F of this Part.
- (e) Harmonic emissions appearing in the restricted bands above 17.7 GHz from field disturbance sensors operating under provisions of Section 15.245 shall not exceed the limits specified in Section 15.245(b).

6.3 Purpose

The purpose of this test was to evaluate the radiated electromagnetic interference characteristics of the EUT.

6.4 Test Procedures

The EUT was placed on a 1 meter long by 1.5 meters wide by 0.8 meter high nonconductive table that was placed directly onto a flush mounted turn table. The EUT was connected to its associated peripherals with any excess I/O cabling bundled to approximately 1 meter.

Prescan tests were performed to determine the “worst-case” mode of operation. With the EUT operating in “worst-case” mode, emissions from the unit were maximized by manipulating the cables, and by adjusting the polarization and height of the Detection System’s receive antenna and rotating the EUT on the turntable.

Note: During testing, the EUT’s Antennas were oriented in accordance with the manufacturer’s installation requirement.
