4 Subject of Investigation

The objective of the measurements applied by CETECOM Inc. was to establish compliance of the EUT as described under Ch. 3 of this Test Report, with the applicable criteria specified in FCC rules Part 15.247 of Title 47 of the Code of Federal Regulations and Radio Standard Specification RSS-210 Issue 8 of Industry Canada.

This test report is to support a request for new equipment authorization under the FCC ID **O2Z-EP110** and IC ID **1000W-EP110**.

According to Public Notice “DA 00-705: March 30, 2000” testing of FHSS systems shall consider modulation and packet type of the signal:

All testing against power limits has been performed for the three supported modulations except the radiated and AC power line emissions which have been tested only on the highest conducted output power modulation GFSK (see results). All testing has been performed on the longest packet type (5) only as this has influence only on the duty cycle and not on the power. See below.

- Conducted spurious emissions test against non-restricted band limits is NOT PERFORMED since radiated spurious emissions against more stringent restricted band limits over the complete measurement range (9kHz to 26GHz) is passed.

6 Measurements

6.1 Measurement Uncertainty

	Uncertainty in dB radiated <30MHz	Uncertainty in in dB radiated 30MHz - 1GHz	Uncertainty in dB radiated > 1GHz	Uncertainty in dB Conducted measurement
standard deviation k=1	2.48	1.93	2.16	0.63

95% confidence interval in dB in delta to Result	+2.5 dB	+2.0 dB	+2.3dB	+0.7dB

6.2 Test Conditions

Temperature: 19°C to 25°C;

Operating Voltage: 3.8V for radio measurements;

Operating Voltage: 4.2V for emission measurements due to connected charger;

Relative Humidity 20% to 50%

6.3 Radiated Emissions Measurement Setup and Procedure

The radiated measurement is performed according to:

ANSI C63.4 (2009)

ANSI C63.10 (2009)

- The exploratory measurement is accomplished by running a matrix of 16 sweeps over the required frequency range with R&S Test-SW EMC32 for 4 positions of the turntable, two orthogonal positions of the EUT and both antenna polarizations. This procedure exceeds the requirement of the above standards to cover the 3 orthogonal axis of the EUT. A max peak detector is utilized during the exploratory measurement. The Test-SW creates an overall maximum trace for all 16 sweeps and saves the settings for each point of this trace. The maximum trace is part of the test report.
- The 10 highest emissions are selected with an automatic algorithm of EMC32 searching for peaks in the noise floor and ensuring that broadband signals are not selected multiple times.
- The maxima are then put through the final measurement and again maximized in a 90deg range of the turntable, fine search in frequency domain and height scan between 1m and 4m.
- The above procedure is repeated for all possible ways of power supply to EUT and for all supported modulations.
- In case there are no emissions above noise floor level only the maximum trace is reported as described above.
- The results are split up into up to 4 frequency ranges due to antenna bandwidth restrictions. A magnetic loop is used from 9kHz to 30MHz, a Biconlog antenna is used from 30MHz to 1GHz, two different horn antennas are used to cover frequencies up to 40GHz.

6.3.1 Sample Calculations for Radiated Measurements

6.3.1.1 Field Strength Measurements:

Measurements from the Spectrum Analyzer/ Receiver are used to calculate the Field Strength, taking into account the following parameters:

1. Measured reading in dB μ V
2. Cable Loss between the receiving antenna and SA in dB and
3. Antenna Factor in dB/m

FS (dB μ V/m) = Measured Value on SA (dB μ V) + Cable Loss (dB) + Antenna Factor (dB/m)

Eg:

Frequency (MHz)	Measured SA (dB μ V)	Cable Loss (dB)	Antenna Factor Correction (dB)	Field Strength Result (dB μ V/m)
1000	80.5	3.5	14	98.0

All radiated measurement plots in this report are taken from a test SW that calculates the Field Strength based on the above equation.

6.3.1.2 Power Measurements using Substitution Procedure:

The measurement on the Spectrum Analyzer is used as a basis for the Substitution procedure.

The EUT is replaced with a Signal Generator and an antenna. The setting on the Signal Generator is varied until the Spectrum Analyzer displays the original reading. EIRP is calculated as-

EIRP (dBm) = Signal Generator setting (dBm) - Cable Loss (dB) + Antenna Gain (dBi)

Eg:

Frequency (MHz)	Measured SA (dB μ V)	Signal Generator setting (dBm)	Antenna Gain (dBi)	Dipole Gain (dBd)	Cable Loss (dB)	EIRP (dBm)
1000	95.5	24.5	6.5	0	3.5	27.5

6.4 Conducted Measurement Setup and Procedure

7 Maximum Peak Conducted Output Power

7.1 Limits:

Maximum Peak Conducted Output Power:

FCC §15.247 (b)(1): 1W

IC RSS-210 issue 8, annex 8.4(2): 1W

EIRP:

IC RSS-210 issue 8, annex 8.4(2): 4W

7.2 Test Procedure

Refer to DA 00-705:2000

Peak Output Power

Use the following spectrum analyzer settings:

Span = approximately 5 times the 20 dB bandwidth, centered on a hopping channel

RBW > the 20 dB bandwidth of the emission being measured

VBW ≥ RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. The indicated level is the peak output power (see the NOTE above regarding external attenuation and cable loss). The limit is specified in one of the subparagraphs of this Section. Submit this plot. A peak responding power meter may be used instead of a spectrum analyzer.

FCC15.247 (d)

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required. In addition, radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

RSS-210 A8.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB.

8.2 Test Procedure**8.2.1 For non-restricted bands from DA 00-705:2000**

Band-edge Compliance of RF Conducted Emissions

Use the following spectrum analyzer settings:

Span = wide enough to capture the peak level of the emission operating on the channel closest to the bandedge, as well as any modulation products which fall outside of the authorized band of operation

RBW $\geq$ 1% of the span

VBW $\geq$ RBW

Sweep = auto

Detector function = peak

Trace = max hold

Allow the trace to stabilize. Set the marker on the emission at the bandedge, or on the highest modulation product outside of the band, if this level is greater than that at the bandedge. Enable the marker-delta function, then use the marker-to-peak function to move the marker to the peak of the in-band emission. The marker-delta value now displayed must comply with the limit specified in this Section. Submit this plot.

Now, using the same instrument settings, enable the hopping function of the EUT. Allow the trace to stabilize. Follow the same procedure listed above to determine if any spurious emissions caused by the hopping function also comply with the specified limit. Submit this plot.

8.2.2 For restricted bands according to 15.35:

RBW = 1MHz (no relaxation because high channel more than 2MHz from limit line)

VBW > 3xRBW

Detector = Peak/Average

8.3 Measurement Result

Pass.

8.4 Test Data/plots:

8.4.1 Lower Band edge non restricted

Lower band edge peak -GFSK modulation (Hopping Disable)

Lower band edge peak -GFSK modulation (Hopping Enable)

Lower band edge peak - $\pi/4$ DPSK modulation (Hopping Disable)

Lower band edge peak - $\pi/4$ DPSK modulation (Hopping Enable)

Lower band edge peak - 8DPSK modulation (Hopping Disable)

Lower band edge peak - 8DPSK modulation (Hopping Enable)

8.4.2 Upper Band edge restricted

Channel 19 Restricted band peak -8-DPSK modulation -3DH5 (Hopping Disabled)

Date: 14.OCT.2014 16:26:05

Note:

The above plot passes peak measurement against the average limit (-41.2dBm). Thus average measurement is not performed.

In order to correct the limit to the specified RBW of 1MHz $10\text{dB} = 10 \times \log_{10}(1000\text{kHz}/100\text{kHz})$ must be subtracted. According to the DTS KDB another 2dB must be subtracted to account for a minimum gain of 2dBi. This results in a limit line at -53.2dBm.

Chennel 79 Restricted band peak -8-DPSK modulation -3DH5 (Hopping Enable)

Date: 14.OCT.2014 16:32:53

Note:

The above plot passes peak measurement against the average limit (-41.2dBm). Thus average measurement is not performed.

In order to correct the limit to the specified RBW of 1MHz $10\text{dB} = 10 \times \log_{10}(1000\text{kHz}/100\text{kHz})$ must be subtracted. According to the DTS KDB another 2dB must be subtracted to account for a minimum gain of 2dBi. This results in a limit line at -53.2dBm.

9 20dB Bandwidth / 99% Bandwidth

9.1 Limits:

§15.247 (a) (1), RSS-210 A8.1 (d)

Frequency hopping systems operating in the 2400–2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW.

9.2 Test Conditions:

Tnom: 21°C; Vnom: 3.8 V

10 Carrier Frequency Separation

10.1 Limits:

§ 15.247 (a) (1) & RSS-210 (A8.1) (b)

Minimum 25 kHz or 2/3 of the 20dB bandwidth of the hopping system

10.2 Test Conditions:

Tnom: 22°C; Vnom: 3.8 V

Hopping ON

10.3 Test Procedure:

Measurement according to DA 00-705:2000

Hopping function: enabled

Spectrum Analyzer settings:

Span = Wide enough to capture the peaks of the two adjacent channels

RBW $\geq$ 1% of the span

VBW $\geq$ RBW or 3X

Sweep = auto

Detector function = peak

Trace = max hold

Use marker-delta function to determine the separation between the peak of the two adjacent channels.

10.4 Test result:

Channel Separation: 1.009 MHz

Pass

11 Number of hopping channels

11.1 Limits:

§ 15.247 (a) (1) (ii) (iii) & RSS-210 A8.1 (d) (e)

At least 15 non-overlapping channels

11.2 Test Conditions:

Tnom: 22°C; Vnom: 3.8 V

11.3 Test Procedure:

Measurement according to DA 00-705

Hopping function: enabled

Spectrum Analyzer settings:

Span = the entire frequency band of operation

RBW $\geq$ 50 KHz

VBW $\geq$ RBW or 3X

Sweep = auto

Detector function = peak

Trace = max hold

The EUT must have its hopping function enabled during the test.

11.4 Test Result:

Number of hopping channels: 79

11.5 Test data/plot:

1st Segment (Total Hopping channels = 38.5)

2nd Segment (Total Hopping channels = 40.5)

12 Time of occupancy (Dwell time)

12.1 Limits:

§ 15.247 (a) (1) (iii) & RSS-210 A8.1 (d) (e)

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed. Frequency hopping systems may avoid or suppress transmissions on a particular hopping frequency provided that a minimum of 15 channels are used.

12.2 Time occupancy calculation

For Bluetooth devices

The dwell time of 0.4 s within a 31.6 second period in data mode is independent from the packet type (packet length). The calculation for a 31.6 second period is as follows:

Dwell time = time slot length * hop rate / number of hopping channels * 31.6 s

Example for a DH1 packet (with a maximum length of one time slot)

Dwell time = $625 \mu\text{s} * 1600 \text{ 1/s} / 79 * 31.6 \text{ s} = 0.4 \text{ s}$ (in a 31.6 s period)

For multi-slot packet the hopping is reduced according to the length of the packet.

Example for a DH5 packet (with a maximum length of five time slots)

Dwell time = $5 * 625 \mu\text{s} * 1600 * 1/5 * 1/s / 79 * 31.6 \text{ s} = 0.4 \text{ s}$ (in a 31.6 s period)

This is according to Bluetooth Core Specification for all Bluetooth devices. Therefore all qualified Bluetooth devices satisfy the FCC requirement on time of occupancy (dwell time).

12.3 Test Result

Pass.

Radiated emissions which fall in the restricted bands, as defined in §15.205(a), must also comply with the radiated emission limits specified in §15.209(a) (see §15.205(c)).

*PEAK LIMIT= 74dB μ V/m

*AVG. LIMIT= 54dB μ V/m

Table 1:

Frequency of emission (MHz)	Field strength @ 3m (μ V/m)	Field strength @ 3m (dB μ V/m)
30–88	100	40dB μ V/m
88–216	150	43.5 dB μ V/m
216–960	200	46 dB μ V/m
Above 960	500	54 dB μ V/m

Table 2:

Frequency of emission (MHz)	Field strength ($\mu\text{V/m}$) / (dBuV/m)	Measurement Distance (m)
0.009–0.490	2400/F(kHz) / -----	300
0.490–1.705	24000/F(kHz) / -----	30
1.705–30.0	30 / (29.5)	30

Radiated spurious emissions shall be measured for the transmit frequencies, transmit power, and data rate for the lowest, middle and highest channel in each frequency band of operation and for the highest gain antenna for each antenna type, and using the appropriate parameters and test requirements described in 5.4.

The highest (or worst-case) data rate shall be recorded for each measurement.

When testing at other than specified distance the limits in dBuV/m are converted according to the following rule:

Below 30MHz:

acc. to FCC §15.31 (f) (2) 40dB/decade. This means that limits are relaxed by 40dB in case the measurement distance is reduced by factor 10.

Above 30MHz:

acc. to FCC §15.31 (f) (1) 20dB/decade. This means that limits are relaxed by 20dB in case the measurement distance is reduced by factor 10.

13.2 Test Conditions

Tnom: 23°C; Vnom: 3.8V

13.3 Test Procedure

Measurement according to ANSI C63.10:2009

Refer to section 6, 6.1 in this test report

Analyzer Settings:

From 9 KHz – 30 MHz

RBW = 9 KHz

Detector: Peak

From 30 MHz – 1 GHz

Detector = Peak / Quasi-Peak

RBW=120 KHz (<1GHz)

Above 1 GHz

Detector = Peak / Average

RBW= 1MHz

Test mode: *Modulation:* GFSK (DM5) used due to the highest conducted output power.

Unless mentioned otherwise, the emissions outside the limit lines in the plots are from the transmit signal.

Plots reported here represent the worst case emissions for horizontal and vertical antenna polarizations and for three orientations of the EUT.

14 AC Power Line Conducted Emissions

The purpose of this test is to measure unwanted radio frequency currents induced in any AC conductor external to the equipment which could conduct interference to other equipment via the AC electrical network.

14.1 Limits:

§15.207 & RSS-Gen 8.8

(a) Except as shown in paragraphs (b) and (c) of this section of the CFR, for an intentional radiator that is designed to be connected to the public utility (AC) power line, the radio frequency voltage that is conducted back onto the AC power line on any frequency or frequencies, within the band 150 kHz to 30 MHz, shall not exceed the limits in the following table (1), as measured using a 50 μ H/50 ohms line impedance stabilization network (LISN). Compliance with the provisions of this paragraph shall be based on the measurement of the radio frequency voltage between each power line and ground at the power terminal. The lower limit applies at the boundary between the frequency ranges.

Table 1:

Frequency of emission (MHz)	Conducted limit (dB μ V)	
	Quasi-peak	Average
0.15–0.5	66 to 56*	56 to 46*
0.5–5	56	46
5–30	60	50

*Decreases with the logarithm of the frequency.

14.2 Test Conditions:

Modulation: 8-DPSK modulation - Transmit and Receive modes of operation
