

Unit and Operation

The Ambience Bath Environment consists of two transceivers. One is a handheld unit used as a remote control, and the other is a base unit to which peripherals are connected. The base unit is modularized so that desired peripherals can be included (plugged in) or excluded (removed) depending on the user's choice.

Peripherals include telephone, AM/FM radio, CD changer, moodlight and proportional heat.

Upon power-up, the remote queries the base unit as to which modules are present. The base unit responds with the present modules, and then the remote allows control of only those modules.

Some of the functions controlled by the remote include heat control, time control, volume, bass, treble, lighting control and speakerphone control.

The freedom of using a remote to control these functions allows the user to better enjoy their bathing experience.
