Section 1. Summary of Test ResultsModel No.: **TX-3314S**Sample No.: **S02**General: **All measurements are traceable to national standards.**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with Part 15, Subpart C, Paragraph 15.231. All tests were conducted using measurement procedure ANSI C63.4-1992. Radiated emissions are made on an open area test site. A description of the test facility is on file with the FCC.

FCC PART 15, SUBPART C
FOR LOW POWER TRANSMITTERS

EQUIPMENT: **TX-3314S**

FCC ID.: **O4TTX3314S**

PROJECT NO.: **0L0237RUS1**

Description of E.U.T.

The device is a key fob remote transmitter that is momentarily activated by pressing a button.

Modifications Incorporated in E.U.T.

The EUT has not been modified from what is described by the brand name and unique type identification stated above.

EQUIPMENT: **TX-3314S**

FCC ID.: **O4TTX3314S**

PROJECT NO.: **0L0237RUS1**

Justification

The E.U.T. was configured for testing as per typical installation.

The following combinations were investigated to establish worst case configuration:

- (1) Lying flat
- (2) Standing vertically on its side.
- (3) Standing vertically on its end.

Exercise Program

The E.U.T. exercise program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to typical use.

Exercise mode:

- (1) Continuous transmit, Black button depressed.
- (2) Continuous transmit, Green button depressed.

Section 4. Transmission Requirements

NAME OF TEST: Transmission Requirements	PARA. NO.: 15.231(a)
TESTED BY: Kevin Rose	DATE: 7/18/00

- Minimum Standard:** 15.231(a) Continuous transmissions such as voice, video or data transmissions are not permitted.
- 15.231(a)(1) A manually operated transmitter shall employ a switch that will automatically deactivate the transmitter within not more than 5 seconds after being released.
- 15.231(a)(2) A transmitter activated automatically shall cease transmission within 5 seconds of activation.
- 15.231(a)(3) Periodic transmissions at regular pre-determined intervals are not permitted. However polling or supervisory transmissions to determine system integrity of transmitters used in security or safety applications are allowed if the periodic rate of transmission does not exceed one transmission of not more than one second duration per hour for each transmitter.
- 15.231(a)(4) Intentional radiators which are employed for radio control purposes during emergencies involving fire, security, and safety of life, when activated to signal an alarm, may operate during the pendency of the alarm.

Test Results: [Complies](#)**Test Data:** [Compliance was determined by verification of technical specification and a functional test on the equipment.](#)

EQUIPMENT: **TX-3314S**

FCC ID.: **O4TTX3314S**

PROJECT NO.: **0L0237RUS1**

Rationale for Compliance with Transmission Requirements

The EUT transmits a unique code but does not transmit any data information.

- 15.231(a)(1) :** The transmission is de-activated within 24.4 μ sec. after the user releases the tx button. See graph on page 16.
- 15.231(a)(2) :** The transmitter is not activated automatically.
- 15.231(a)(3) :** The transmitter only transmits when the TX button is pressed. There are no automatic transmissions at pre-determined intervals.
- 15.231(a)(4) :** The transmitter is for remote actuation and thus transmits a short burst when activated by the user.

NAME OF TEST: Radiated Emissions	PARA. NO.: 15.231(b)
TESTED BY: Kevin Rose	DATE: 7/27/00

Minimum Standard:**Permissible Field Strength Limits (Momentarily Operated Devices)**

Fundamental Frequency (MHz)	Field Strength of Fundamental Microvolts/Meter at 3 meters; (watts)	Field Strength of Unwanted Emissions Microvolts/Meter at 3 meters; (watts)
40.66 - 40.70	2,250	225
70-130	1, 250	125
130-174	1,250 to 3,750*	125 to 375
174-260 (note 1)	3,750	375
260-470 (note 1)	3,750 to 12,500*	375 to 1,250
Above 470	12,500	1,250

Notes:

# Use quasi-peak or averaging meter.	For 130 - 174 MHz: FS (microvolts/m) = (56.82 x F) - 6136
* Linear interpolation with frequency F in MHz	For 260 - 470 MHz: FS (microvolts/m) = (41.67 x F) - 7083

Any emissions that fall within the restricted bands of 15.205 shall not exceed the following limits:

Frequency (MHz)	Field Strength (mV/m @ 3m)	Field Strength (dB @ 3m)
30 - 88	100	40.0
88 - 216	150	43.5
216 - 960	200	46.0
Above 960	500	54.0

Test Results:

Complies. The worst-case emission level is 77.9 dBμV/m @ 3m at 433.9 MHz in the horizontal polarization. This is 3.1 dB below the specification limit of 81 dBμV/m. This emission is the fundamental transmit emission. The worst-case spurious emission level is 49.8 dBμV/m @ 3m at 1.3 GHz. This is 4.2 dB below the 54 dBμV/m limit.

Test Data:

See attached table.

Above 1 GHz a spectrum analyzer and low noise amplifier are used to measure emission levels. The spectrum analyzer resolution bandwidth was set to 1 MHz and video bandwidth was 3 MHz.

In the case of handheld equipment, the E.U.T. is rotated in three planes to obtain worst-case results.

Minimum Standard:

Frequency(MHz)	Maximum Powerline Conducted RF Voltage	
	mV	dBm
0.45 - 30.0	250	-38

Test Results: Complies with attached graphs and table.**Test Data:** See attached graphs and table.**Method Of Measurement: (Procedure ANSI C63.4-1992)**

Measurements were made using a spectrum analyzer with 10 kHz RBW, Peak detector. Any emissions that are close to the limit are measured using a test receiver with 10 kHz bandwidth, CISPR Quasi-Peak detector.

Broadband emissions are identified by switching the receiver detector function from Quasi-Peak to Average. If the amplitude of the emission drops by 6 dB or more then the emission is classified as broadband and the Quasi-Peak level is reduced by a factor of 13 dB.

All emissions within 10 dB of limit have been recorded.
