Thank you for purchasing this innovative LOGIC device. The specifications in this document are subject to change without prior notice.		Install SIM card / memory card.		Connect your Logic phone to the computer using the USB cable.		FCC Statement 1. This device complies with Part 15 of the FCC Rules. Operations subject to the following conditions: (a) This device may not cause harmful interference. (b) This device must accept any interference received, including interference that may cause undesired operation. 2. Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment. The equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential environment. The equipment generates and can radiate radio frequency energy and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: •Reorient or relocate the receiving antenna. •Increase the separation between the equipment and receiver. •Connect the equipment to a power outlet on a circuit different from that to which the receiver is connected. •Consult the dealer or an experienced radio/TV technician for help.		iF558 With body-worn measurements offer among phone models, depending upon cellular accessories and FCC requirements. The maximum SAR for SAR in head mode is 0.57 W/kg. While there may be differences between the SAR levels of various phones and at various positions, they must meet the government requirement for safe exposure. The FCC has granted an Equipment Authorization for this model phone with the reported SAR level indicated as in compliance with the FCC frequency guidelines. SAR information on this model phone is on file with the FCC and can be found under the Cellular section of http://www.fcc.gov without after searching on FCC ID: C55000222. Additional information on Specific Absorption Rate (SAR) can be found on the Cellular Telecommunications Industry Association (CTIA) website at http://www.ctia.com . In the United States and Canada, the SAR limit for mobile phones used by the public is 1.6 W/kg (SAR) averaged over one gram of tissue. The standard incorporates a substantial margin of safety to give additional protection for the public and to account for any variations in measurements.		Body-worn Operation This device was tested for specific body-worn operations. To comply with RF exposure requirements, a minimum separation distance of 10mm must be maintained between the user's body and the handset, including the antenna. Therefore, talk-listen, hold-to-talk, and other accessories used by the device should not contain any metal components. Body-worn accessories that do not meet these requirements may not comply with RF exposure requirements and should be used only with the handset or an approved antenna.		SAR Information Statement Your wireless phone is a radio transmitter and receiver. It is designed and manufactured not to exceed the emission limits for exposure to radiofrequency (RF) energy set by the Federal Communications Commission of the U.S. Government. These limits are part of comprehensive guidelines and establish permitted levels of RF energy for the general population. The guidelines are based on standards that were developed by independent scientific organizations through periodic and thorough evaluation of scientific studies. The standards include a substantial safety margin designed to assure the safety of all persons, regardless of age and health. The exposure standard for wireless mobile phones employs a unit of measurement known as the Specific Absorption Rate, or SAR. The SAR limit set by the FCC is 1.6 W/kg. Tests for SAR are conducted with the phone transmitting at its highest certified power level at tested frequency bands. Although the SAR is determined at the highest certified power level, the actual SAR level of the phone at the operating power level is lower than the maximum SAR. This is because the phone is designed to operate at multiple power levels so as to use only the power required to reach the network. In general, the closer you are to a wireless base station antenna, the lower the power output. Before a phone model is available for sale to the public, it must be tested and certified to the FCC that it does not exceed the limit established by the government adopted equipment for safe exposure. The tests are performed in positions and locations typical of use and vary on the basis of requirements for the FCC for each model. The highest SAR value for this model phone when tested for use at the ear is 0.558 W/kg and when worn on the body, as described in this user guide.
