ENGINEERING TEST REPORT ON RA54 KODEN MARINE RADAR

APPLICANT: KODEN ELECTRONICS CO., LTD
EQUIPMENT: MARINE RADAR
TEST SITE: UENOHARA-FACTORY OF KODEN ELECTRONICS CO., LTD
TEST DATE: July in 2001
To: Whom it concern

Good engineering practice were followed while performing test for FCC type acceptance application, and the result are accurate.

Respectfully,

Report Prepared by:

S.Iwasawa
Engineer of Design Section

Foreword

The following information is being submitted in compliance with paragraphs 2.983, 2.985, 2.987, 2.989, 2.991, 2.993 and 2.995 as provided by part 83 of the FCC Rules and Regulations for Type Acceptance of the Kodan Marine Radar, Type RA54.

All testing was performed by the Kodan Electronics Co., Ltd.

Uenohara Factory, 5278, Uenohara, Uenohara-Machi, Kitatsuru-Gun, Yamanashi, 409-0112, Japan.

STANDARD TEST CONDITIONS

and

ENGINEERING PRACTICES

Except as noted herein, the following conditions and procedure were observed during the testing:

ROOM TEMPERATURE	= 25 +/- 5 Degree-Centigrade
ROOM HUMIDITY	= 20 to 50%

Prior to testing, the E.U.T. was tuned up in accordance with the manufacturer's alignment procedures. All external gain controls were maintained at the position of maximum and/or optimum gain throughout the testing.

MEASUREMENT DATA, unless otherwise noted, are WORST CASE measurements.

TEST PROCEDURE

The Marine Radar is capable of generating the following pulses:

80ns x 2000Hz, 300ns x 1500Hz, 0.6us x 1000Hz, 1.0us x 500Hz

The Power output for each of these combinations was measured by using the following procedure:

- (1) Set up the equipment as shown in Fig.1.
- (2) Record reading of Power Meter.
- (3) Calculate mean power according to attenuation.
- (4) Measure and record pulse width and P.R.F. by using oscilloscope and frequency counter.
- (5) Calculate peak power as follows:

$$P0 = Pm / (Fr \times T)$$

P0 : Peak Power, Pm : Mean Power, Fr : P.R.F.*

T : Pulse Width, * P.R.F. : Pulse Repetition Frequency

TEST PROCEDURER

The Marine Radar is capable of generating the following pulses:

0.08 us x 2000 Hz, 0.3 us x 1500 Hz, 0.6 us x 1000 Hz, 1.0 us x 500 Hz

The Modulation characteristics for each of these combinations was measured by using the following procedure:

- (1) Set up the equipment as shown in Fig.1.
- (2) Obtain a convenient display on the oscilloscope and adjust peak to the suitable cursor line.
- (3) Decrease variable attenuator 3 dB, and measure the pulse width at the cursor line.
- (4) Photograph the oscilloscope display.
- (5) Note and record the Frequency Readout of the counter as "Pulse Repetition Frequency".

TEST PROCEDURE

The Marine Radar is capable of generating the following pulses:

0.08 us x 2000 Hz, 0.3 us x 1500 Hz, 0.6 us x 1000 Hz, 1.0 us x 500 Hz

The occupied bandwidth for each of these combinations was measured by using the following procedure:

- (1) Connect the equipment as shown in Fig.3.
- (2) Adjust center frequency, span reference level of spectrum analyzer and attenuator if necessary, such that the display nearly fills the screen.
- (3) Measure and record spectrum and bandwidth

The bandwidth is calculated so that the total powers lower than the lowest frequency in the bandwidth and higher than the highest frequency in the bandwidth occupy 0.5% of the transmitted total power respectively.

TEST PROCEDURE

The Marine Radar is capable of generating the following pulse:

0.08 us x 2000 Hz, 0.3 us x 1500 Hz, 0.6 us x 1000 Hz, 1.0 us x 500 Hz

The spurious emission at the antenna terminal for each of these combinations were measured by using the following procedure:

- (1) Set up the equipment as shown in Fig.2
- (2) At first, the 0 dB reference level for the main Pulse was established.
- (3) The spectrum was searched over the range 0 to 22 GHz using spectrum analyzer.

NOTE

The FCC limit is calculated as follows:

Spurious limit (L)=43 + 10 Log P, in dB below the transmitter output power, where P is the mean power output in watts (See Exhibit 1).

Exhibit 4

TEST RESULT

9410 MHz	0 dB
2nd	-64 dB

All other spurious and harmonics up to 22 GHz were found to be than -70dB below maximum mean power, and/or 13 dB below limit.

Limit: $-(43 + 10 \log 6.37) = -51.0 \text{ dB}$

mean power: 6.37 watts at 1.0 us X 500 Hz.

CALIBRATION

All test equipment is calibrated and maintained by Koden Quality Assurance Dept.

TEST PROCEDURE

The Marine Radar is capable of generating the following pulses:

80ns x 2000Hz, 300ns x 1500Hz, 0.6us x 1000Hz, 1.0us x 500Hz

The spurious emissions field strength for each of these combination was measured using following procedure.

- (1) Set up the equipment as shown in Fig.3.
- (2) Using the automatic EMI Measuring System, measure and record the spurious radiated emissions from 150 kHz to 1 GHz. The computer in the Measuring system program automatically adds antenna factors and cable losses to the raw voltage measurements to obtain field strength units.
- (3) Set up the equipment as shown in Fig.4.
- (4) Measure and record spurious radiated emissions from 1 GHz to 18GHz (antenna

- limit). Observe and note any emissions from 1GHz to 18 GHz.
- (5) Calculate the field strength of spurious emissions from 1 GHz to 18 GHz by add in antenna factor (including cable loss) to the observed reading. The 3115(Double Ridged Guide) antenna gain and cable loss is calculated by the Table-5.1 below.
- (6) Set up the equipment as shown in Fig.5.
- (7) Using the spectrum analyzer, measure and record terminal interference voltage from 10 kHz to 30 MHz.

5.	Variable Attenuator	Hewlett-Packard	X382A
6.	Power Meter	ANRITSU	ML83A

TEST PROCEDURE

The Marine Radar is capable of generating the following pulses:

80ns x 2000Hz, 300ns x 1500Hz, 0.6us x 1000Hz, 1.0us x 500Hz

The circuitry of the Radar contains a key-inhibit timer that prevents transmission until the magnetron has warmed-up for 2 minutes. Consequently, all data are taken after the 2 minutes warmed-up.

- (1) Set up the equipment in the temperature chamber as shown in Fig.6. Set the chamber to -20 Degree-Centigrade and allow the equipment to stabilize.
- (2) Turn the equipment on and measure the transmitted frequency using the resonate cavity frequency meter. Measure each the pulse types at one minute intervals until unit stability is achieved or 10 minutes have elapsed, whichever is longer.
- (3) Increase the chamber temperature by 10 Degree-Centigrade and repeat step 1 and 2.
Continue in 10 Degree-Centigrade increments until 50 Degree-Centigrade has been achieved.
- (4) Measure the output frequency at room ambient temperature following voltages

applied to the power input.

12V input: Apply 10.2V and 13.8V

24V input: Apply 20.4V and 27.6V

32V input: Apply 27.2V and 36.8V

(5) Calculate test frequency limits from the followings;

The frequency of the principal emission must not be nearer to the edge of the authorized band than $1.5/t$ in MHz, (where t is the shortest pulse used, in micro second).

$t = 80\text{ns}(\text{nominal})$

$1.5/t = 18.8 \text{ MHz}$

Band Limit = 9.300000 to 9.500000 GHz

Emission Limit = 9.3188 to 9.4812 GHz
