Receiver Spurious Emission** RSS-Gen Issue 5 §7.3	See RSS-Gen §7.3 30MHz-88MHz : 40 dBµV/m 88MHz-216MHz : 43.5 dBµV/m 216MHz-960MHz : 46.0 dBµV/m Above 960MHz : 54.0 dBµV/m			☒ PASS ☐ FAIL ☐ NA ☐ NP

*§15.33: The highest internal source of a testing device is defined like more the highest frequency generated or used in the testing device or on which the testing device works or agrees.

- If the highest frequency of the internal sources of the testing device is lower than 108 MHz, measurement must be only performed until 1GHz.

- If the highest frequency of the internal sources of the testing device ranges between 108 MHz and 500 MHz, measurement must be only performed until 2GHz.

- If the highest frequency of the internal sources of the testing device ranges between 500 MHz and 1 GHz, measurement must be only performed until 5GHz.

If the highest frequency of the internal sources of the testing device is above 1 GHz, measurement must be only performed until 5 times the highest frequency or 40 GHz, while taking smallest of both.

**Testing covered the receive mode, and receiver spurious emissions are considered to be the same as transmitter.

2. SYSTEM TEST CONFIGURATION

2.1. HARDWARE IDENTIFICATION (EUT AND AUXILIARIES):

Equipment under test (EUT):
ASTEELFLASH NEO BT PRO

Serial Number: RF SIMPLE

Equipment Under Test

Power supply:

During all the tests, EUT is supplied by Vnom: 4.5 VDC

For measurement with different voltage, it will be presented in test method.

Name	Type	Rating	Reference / Sn	Comments
Supply1	☐ AC ☐ DC ☒ Battery	3*1.5 VDC		

Inputs/outputs - Cable:

Access	Type	Length used (m)	Declared <3m	Shielded	Under test	Comments
No input or output						

Equipment information (declaration of provider):

EQUIPMENT INFORMATION				
RF module:	Not communicated			
Frequency Carrier:	[457 kHz]			
Sub-band REC7003:	ANNEX 2 – Band a1 [456.9-457.1kHz]			
RF mode:	☒ Transmitter	☐ Transceiver	☒ Receiver	☐ Standby
Antenna type:	☐ External:		☒ Internal:	
Antenna gain:	Not communicated			
Equipment location	☒ Mobile station		☐ Fixed station	
Extreme temperature range:	☐ Category (General): -20°C to +50°C		☐ other*: From -30 to 55°C	
Extreme test source voltage:	☐ ±15%:	☐ other*: From 4.05VDC to 4.95VDC		
Rmq: *ask from provider				

2.2. EUT CONFIGURATION

A special configuration of the EUT permits:

- Permanent emission of the carrier frequency with modulation
- Permanent RX mode

2.3. EQUIPMENT MODIFICATIONS

☒ None ☐ Modification:

2.4. FIELD STRENGTH CALCULATION

The field strength is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain (if any) from the measured reading. The basic equation with a sample calculation is as follow:

$$FS = RA + AF + CF - AG$$

Where
 FS = Field Strength
 RA = Receiver Amplitude
 AF = Antenna Factor
 CF = Cable Factor
 AG = Amplifier Gain

Assume a receiver reading of 52.5dBμV is obtained. The antenna factor of 7.4 and a cable factor of 1.1 are added. The amplifier gain of 29dB is subtracted, giving a field strength of 32 dBμV/m.

$$FS = 52.5 + 7.4 + 1.1 - 29 = 32 \text{ dB}\mu\text{V/m}$$

The 32 dBμV/m value can be mathematically converted to its corresponding level in μV/m.

$$\text{Level in } \mu\text{V/m} = \text{Common Antilogarithm } [(32\text{dB}\mu\text{V/m})/20] = 39.8 \mu\text{V/m}.$$

2.5. CALIBRATION DATE

The calibration intervals are extended at 12+2 months. This extended interval is based on the fact that there is sufficient calibration data to statistically establish a trend or based on experience of use of the test equipment to assure good measurement results for a longer period

3. RADIATED EMISSION DATA (15.209)

3.1. ENVIRONMENTAL CONDITIONS

Test performed by : Mounir BOUAMARA
Date of test : November 4, 2021
Ambient temperature : 23 °C
Relative humidity : 23 %

3.2. TEST SETUP

The installation of EUT is identical for pre-characterization measures in a 3 meters semi- anechoic chamber and for measures on the 10 meters Open site.

The EUT and auxiliaries are set:

- ☒ 80cm above the ground on the non-conducting table (Table-top equipment) - Below 1GHz
- ☐ 10cm above the ground on isolating support (Floor standing equipment)

The EUT is powered by V_{nom} .

Test setup on OATS

3.3. TEST METHOD

The product has been tested according to ANSI C63.10, FCC Part 15 Subpart C.

Pre-characterisation measurement: (9kHz – 1GHz)

A pre-scan of all the setup has been performed in a 3 meters semi-anechoic chamber for frequency from 30MHz to 1GHz. Test is performed in horizontal (H) and vertical (V) polarization, the loop antenna was rotated during the test for maximized the emission measurement. Continuous linear turntable azimuth search was performed with 360 degrees range. Measurement performed on all axis of EUT used in normal configuration.

Characterization on 10 meters open site from 9kHz to 1GHz:

Radiated Emissions were measured on an open area test site. A description of the facility is on file with the FCC. The product has been tested at a distance of **10 meters** from the antenna and compared to the FCC Part 15 Subpart C limits. Measurement bandwidth was 9kHz below 30MHz and 120kHz from 30 MHz to 1GHz. Test is performed in horizontal (H) and vertical (V) polarization, the loop antenna was rotated during the test for maximized the emission measurement. The height antenna is varied from 1m to 4m. Continuous linear turntable azimuth search was performed with 360 degrees range. Measurement performed on all axis of EUT used in normal configuration. A summary of the worst case emissions found in all test configurations and modes is shown. Frequency list has been created with anechoic chamber pre-scan results.

No frequency observed, margin >20dB in pre-characterization									

3.7. CONCLUSION

The sample of the equipment **ASTEELFLASH NEO BT PRO**, Sn: **RF SIMPLE**, tested in the configuration presented in this test report **compliant** to requirements of class B limits of the standard FCC Part 15 Subpart C, for radiated emissions.

4. FUNDAMENTAL FREQUENCY TOLERANCE (RSS)

4.1. ENVIRONMENTAL CONDITIONS

Test performed by : Mounir BOUAMARA
Date of test : November 4, 2021
Ambient temperature : 23 °C
Relative humidity : 23 %

4.2. TEST SETUP

Frequency of carrier: 457kHz

The equipment (RF box) is set in a climatic chamber. Measure is performed on one channel of RF module.

Test setup

4.3. TEST METHOD

The frequency tolerance of the carrier signal shall be maintained within $\pm 0.01\%$ of the operating frequency when the temperature is varied from -20°C to $+50^{\circ}\text{C}$ at the nominal power voltage and the primary power voltage is varied from battery's operating end-point voltage to nominal voltage at 20°C .

	Frequency Drift (%)	-0.0003%	0.0000%	-0.0016%
4.95	Frequency (kHz)	456.9987	457	456.9924
	Frequency Drift (%)	-0.0003%	0.0000%	-0.0017%

Frequency drift measured is **7.6Hz** when the temperature is varied from -30°C to +50°C and voltage is varied.

4.1. CONCLUSION

The sample of the equipment **ASTEELFLASH NEO BT PRO**, SN: **RF SIMPLE**, tested in the configuration presented in this test report **compliant** to requirements of the standard FCC Part 15 Subpart C, for fundamental frequency tolerance.

5. OCCUPIED BANDWIDTH

5.1. ENVIRONMENTAL CONDITIONS

Test performed by : Mounir BOUAMARA
 Date of test : November 4, 2021
 Ambient temperature : 23 °C
 Relative humidity : 23 %

5.2. SETUP

☐ **Conducted measurement:**

The EUT is turned ON and connected to measurement instrument; the center frequency of the spectrum analyzer is set to the fundamental frequency. The captured power is measured and recorded; the measurement is repeated until all frequencies required were complete.

☐ **Radiated measurement:**

The EUT is turned ON and connected to measurement instrument; the center frequency of the spectrum analyzer is set to the fundamental frequency. The captured power is measured and recorded; the measurement is repeated until all frequencies required were complete.

Measurement Procedure:

1. RBW used in the range of 1% to 5% of the anticipated emission bandwidth
2. Set the video bandwidth (VBW) $\geq 3 \times$ RBW.
3. Detector = Peak.
4. Trace mode = Max Hold.
5. Sweep = Auto couple.
6. Allow the trace to stabilize.
7. OBW 99% function of spectrum analyzer used

6.7. CONCLUSION

The sample of the equipment **ASTEELFLASH NEO BT PRO**, SN: **RF SIMPLE**, tested in the configuration presented in this test report **compliant** to requirements of the standard RSS GEN, for Receiver Spurious Emission.

7. UNCERTAINTIES CHART

Type de mesure / Kind of measurement	Incertitude élargie laboratoire / Wide uncertainty laboratory (k=2) ± x	Incertitude limite du CISPR / CISPR uncertainty limit ± y
Measurement of conducted disturbances in voltage on the power port	3.29dB	3.4 dB
Measurement of conducted disturbances in voltage on the telecommunication port.	3.26 dB	5dB
Measurement of discontinuous conducted disturbances in voltage	3.33 dB	3.4 dB
Measurement of conducted disturbances in current	2.67 dB	2.9dB
Spurious emission, radiated (Semi anechoic chamber & open test site)	5.60 dB	6 dB
Spurious emission, radiated (Full anechoic chamber above 1GHz)	±3.8 dB	±6 dB
Occupied Channel Bandwidth	±2.8 %	±5 %
Temperature	±0.75 °C	±3 °C
Supply Voltages	±1.7 %	±3 %

Les valeurs d'incertitudes calculées du laboratoire étant inférieures aux valeurs d'incertitudes limites établies par la norme, la conformité de l'échantillon est établie directement par les niveaux limites applicables. / The uncertainty values calculated by the laboratory are lower than limit uncertainty values defined by the standard. The conformity of the sample is directly established by the applicable limits values.
