

REPORT OF MEASUREMENTS

GENERAL

Applicant: Safeguard Technology Inc.
Device: 10.525 GHz Field Disturbance Sensor
Model: IME250
Serial Number: N/A
FCC ID: OA4IME250
Input Power Requirements: 24 VAC
Rule Section: Part 15, Subpart C, Section 15.245

TEST METHODS PERFORMED

15.207 (a) Conducted Emissions, 450Khz to 30 MHz
15.245 (b) Radiated Emissions, Fundamental
15.245 (b)(1) Radiated Emissions, Harmonics
15.245 (b)(3) Radiated Emissions, Band Edges
15.245 (b)(3) Radiated Emissions, Spurious Emissions, 30 MHz to 52.625 GHz

TEST RESULTS

15.245 (a) The device is an intentional radiator used as a field disturbance sensor.
15.245 (b) The device operates within the 10.500 to 10.550 GHz frequency band.
The field strength of the fundamental emission did not exceed 2500 millivolts per meter, average.
15.245 (b)(1) The device does not produce harmonic emissions below 17.7 GHz.
15.245 (b)(1)(ii) The device is intended to be used outside of buildings and the field strength of harmonic emissions did not exceed 7.5 millivolts per meter.
15.245 (b)(2) All radiated emissions measurements were extrapolated to the specified 3 meter test distance.
15.245 (b)(3) The emissions radiated outside of the specified frequency band of 10.500 to

10.550 GHz did not exceed the general radiated emission limits of 15.209.

15.245 (b)(4) The requirements of 15.35 for averaging pulsed emissions and limiting peak emissions were met.

NOTES

15.31 (a)(b) All measurements were made in accordance with ANSI C63.4:1992.

15.31 (c) The device does not use swept frequency techniques.

15.31 (d) All testing was performed on Retlif Testing Laboratories Ronkonkoma, NY test site, which has been listed with the FCC.

15.31 (e) Variation of the radiated signal level of the fundamental frequency component was performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage

15.31 (f)(1) Where testing was performed at distances other than the specified test distance, the obtained readings were extrapolated to the specified test distance using an inverse linear-distance extrapolation factor (20 dB / decade) for measurements between 30 MHz and 40 GHz. For measurements at frequencies above 40 GHz, an inverse linear-distance squared factor (40 dB / decade) was utilized.

15.31 (f)(5) The device was rotated 360° in order to maximize the radiated emissions. The maximum field strength observed has been reported.

15.31 (g) All consumer accessible controls were adjusted in order to maximize emissions

15.31 (m) The device operates at a single frequency of 10.5265 GHz.

15.31 (o) All emissions within 20 dB of the specified limits have been reported unless otherwise stated.

15.33 (a)(2) The device operates above 10 and below 30 GHz at a frequency of 10.525 GHz. Therefore radiated emissions measurements were made from 30 MHz to 52.625 GHz, the fifth harmonic.

DUTY CYCLE

This device has a pulsed square wave output, with a maximum repetition frequency of 2400 Hz. This yields a duty cycle of 50.0%, 50.0 mSec divided by 100 mSec. This duty cycle was applied to the obtained peak readings in order to determine the average value of the emissions.

TEST DISTANCES

In order to obtain adequate system sensitivity at the harmonic frequencies of interest, it was necessary to perform certain measurements at a distance less than 3 meters. Care was taken to ensure that all measurements were taken in the far field region. The antenna was determined to be in the far field IFF:

$$d \geq 2 D^2$$

Where: d = Test Distance

D = Largest Antenna Length

= Wavelength at the Frequency of Interest

Solving for d yields the minimum test distances shown in the table below. Also shown is the actual test distance utilized:

Frequency GHz	Minimum Test Distance Meters	Actual Test Distance Meters
10.5265	2.7	3
21.0530	1.5	2
31.5795	1.0	3
42.1060	0.5	2
52.6325	0.7	1

SPECTRUM ANALYZER DESENSITIZATION CONSIDERATIONS

Due to the nature of the emissions being measured, care was taken to ensure that the resolution bandwidth of the spectrum analyzer was adequate to provide accurate peak field strength measurements. The following formula was utilized:

Pulse Desensitization (dB) = $20 \log (\text{Pulsewidth} * \text{bandwidth} * 1.5)$

Setting the above equal to zero and utilizing the 208.3 microsecond pulsewidth yields a minimum required bandwidth of 3200 Hz. The 1 MHz bandwidth specified in ANSI C63.4 was utilized for all fundamental and harmonic measurements.

TEST DATA
