TEST REPORT

Test report no.: 1-8404/14-01-03-A

Deutsche
Akkreditierungsstelle
D-PL-12076-01-01

Testing laboratory

CETECOM ICT Services GmbH

Untertürkheimer Strasse 6 – 10

66117 Saarbrücken / Germany

Phone: + 49 681 5 98 - 0

Fax: + 49 681 5 98 - 9075

Internet: <http://www.cetecom.com>e-mail: ict@cetecom.com**Accredited Testing Laboratory:**

The testing laboratory (area of testing) is accredited according to DIN EN ISO/IEC 17025 (2005) by the Deutsche Akkreditierungsstelle GmbH (DAkkS)

The accreditation is valid for the scope of testing procedures as stated in the accreditation certificate with the registration number: D-PL-12076-01-01

Area of Testing: Radio Communications & EMC (RCE)

Applicant

ADC Automotive Distance Control Systems GmbH

Peter-Dornier-Str. 10

88131 Lindau/Bodensee / GERMANY

Phone: +49 8382 9699-0

Fax: +49 8382 9699-22435

Contact: Frank Gruson

e-mail: frank.gruson@continental-corporation.com

Phone: +49 8382 9699-435

Manufacturer

Conti Temic microelectronic GmbH

Ringlerstrasse 17

85057 Ingolstadt / GERMANY

Test standard/s

47 CFR Part 15

Title 47 of the Code of Federal Regulations; Chapter I
Part 15 - Radio frequency devices

RSS – 210 Issue 8

Low Power Licence-exempt Radiocommunication Devices

Annex 13, Section A13.1 Vehicle -Mounted Field Disturbance Sensors in the Band
76.0 - 77.0 GHz

For further applied test standards please refer to section 3 of this test report.

Test Item

Kind of test item: SRD for RTTT (adaptive cruise control for vehicles)**Model name:** ARS4-B**FCC ID:** OAYARS4B**IC:** 4135A-ARS4B

Frequency: 76.0 - 77.0 GHz

Antenna: Planar patch internal antenna

Power supply: 6.5 – 19.0 V.DC from power supply

Temperature range: -40 °C to +90 °C

2 General information

2.1 Notes and disclaimer

The test results of this test report relate exclusively to the test item specified in this test report. CETECOM ICT Services GmbH does not assume responsibility for any conclusions and generalizations drawn from the test results with regard to other specimens or samples of the type of the equipment represented by the test item.

The test report may only be reproduced or published in full. Reproduction or publication of extracts from the report requires the prior written approval of CETECOM ICT Services GmbH.

The testing service provided by CETECOM ICT Services GmbH has been rendered under the current "General Terms and Conditions for CETECOM ICT Services GmbH".

CETECOM ICT Services GmbH will not be liable for any loss or damage resulting from false, inaccurate, inappropriate or incomplete product information provided by the customer.

Under no circumstances does the CETECOM ICT Services GmbH test report include any endorsement or warranty regarding the functionality, quality or performance of any other product or service provided.

Under no circumstances does the CETECOM ICT Services GmbH test report include or imply any product or service warranties from CETECOM ICT Services GmbH, including, without limitation, any implied warranties of merchantability, fitness for purpose, or non-infringement, all of which are expressly disclaimed by CETECOM ICT Services GmbH.

All rights and remedies regarding vendor's products and services for which CETECOM ICT Services GmbH has prepared this test report shall be provided by the party offering such products or services and not by CETECOM ICT Services GmbH.

In no case this test report can be considered as a Letter of Approval.

	V_{min}	6.50 V DC

5 Test item

Kind of test item	:	SRD for RTTT (adaptive cruise control for vehicles)
Type identification	:	ARS4-B
S/N serial number	:	None
HW hardware status	:	ARS4D2 C1-Sample
SW software status	:	PSW 7.2.6
Frequency band [MHz]	:	76.0 - 77.0 GHz
Type of modulation	:	pulse compression radar modulation
Number of channels	:	1
Antenna	:	Planar patch internal antenna (2 TX - 3 RX)
Power supply	:	6.5 – 19.0 V.DC from power supply
Temperature range	:	-40 °C to +90 °C

5.1 Additional comments

Test setup- and EUT-photos are included in test report:

1-8404/14-01-03-A_AnnexA
1-8404/14-01-03-A_AnnexB
1-8404/14-01-03-A_AnnexD

ARS400-Entry is a 77 GHz radar sensor with digital beam-forming scanning antenna which offers two scans for far and short range. The ARS400-Entry uses a pulse compression radar modulation scheme as basic principle for its measurements. The beam-forming principle is continuously active; the same antennas (2 TX and 3 RX) are used for near range and far range scan. Selecting near range and far range scan is done via selecting different frequency chirps and it is done serially alternating between near and far range.

Special test software was used to change from normal operation mode to stopped mode (low / mid / high) as required by CFR 47 Part 15.31 (c).

Frequencies: low frequency: 76.10 GHz / middle frequency: 76.25 GHz / high frequency: 76.40 GHz

6 Test laboratories sub-contracted

None

8 Description of the test setup

8.1 Radiated measurements chamber F

The radiated measurements are performed in vertical and horizontal plane in the frequency range from 9 kHz to 1 GHz in semi-anechoic chambers. The EUT is positioned on a non-conductive support with a height of 0.80 m above a conductive ground plane that covers the whole chamber. The receiving antennas are confirmed with specifications ANSI C63. These antennas can be moved over the height range between 1.0 m and 4.0 m in order to search for maximum field strength emitted from EUT. The measurement distances between EUT and receiving antennas are indicated in the test setups for the various frequency ranges. For each measurement, the EUT is rotated in all three axes until the maximum field strength is received. The wanted and unwanted emissions are received by spectrum analysers where the detector modes and resolution bandwidths over various frequency ranges are set according to requirement ANSI C63.

9.2 Not in Motion

Refer to 9.1, the maximum average radiated power is 13.87 dBm = 24.38 mW
(at high frequency $T_{\min} / V_{\min} - V_{\max}$)

Limits:

RSS 210 Issue 8, Annex 13.1.2 (1)(a)

200 nW/cm ² (approximately 23.5 dBm) if the vehicle is moving slower than 1 km/hour
--

Result: The measurement is passed.

9.3 Maximum Permissible Exposure (MPE)

MPE Calculation:

$$PD = \frac{OP + AG}{(4 \times \pi \times d^2)}$$

PD = Power Density (mW/cm²)

OP = DUT Output Power (dBm)

AG = DUT Antenna Gain (dBi)

d = MPE Distance (cm)

Note: OP [mW], AG as lin.factor

§ 1.1310 Radiofrequency radiation exposure limits.

The criteria listed in table 1 shall be used to evaluate the environmental impact of human exposure to radiofrequency (RF) radiation as specified in § 1.1307(b), except in the case of portable devices which shall be evaluated according to the provisions of § 2.1093 of this chapter. Further information on evaluating compliance with these limits can be found in the FCC's OST/OET Bulletin Number 65, "Evaluating Compliance with FCC-Specified Guidelines for Human Exposure to Radiofrequency Radiation."

NOTE TO INTRODUCTORY PARAGRAPH: These limits are generally based on recommended exposure guidelines published by the National Council on Radiation Protection and Measurements (NCRP) in "Biological Effects and Exposure Criteria for Radiofrequency Electromagnetic Fields," NCRP Report No. 86, Sections 17.4.1, 17.4.1.1, 17.4.2 and 17.4.3.

Copyright NCRP, 1986, Bethesda, Maryland 20814. In the frequency range from 100 MHz to 1500 MHz, exposure limits for field strength and power density are also generally based on guidelines recommended by the American National Standards Institute (ANSI) in Section 4.1 of "IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 kHz to 300 GHz," ANSI/IEEE C95.1-1992, Copyright 1992 by the Institute of Electrical and Electronics Engineers, Inc., New York, New York 10017.

TABLE 1—LIMITS FOR MAXIMUM PERMISSIBLE EXPOSURE (MPE)

Frequency range (MHz)	Electric field strength (V/m)	Magnetic field strength (A/m)	Power density (mW/cm ²)	Averaging time (minutes)
(A) Limits for Occupational/Controlled Exposures				
0.3–3.0	614	1.63	*(100)	6
3.0–30	1842/f	4.89/f	*(900/f ²)	6
30–300	61.4	0.163	1.0	6
300–1500			f/300	6
1500–100,000			5	6
(B) Limits for General Population/Uncontrolled Exposure				
0.3–1.34	614	1.63	*(100)	30
1.34–30	824/f	2.19/f	*(180/f ²)	30
30–300	27.5	0.073	0.2	30
300–1500			f/1500	30
1500–100,000			1.0	30

f = frequency in MHz

* = Plane-wave equivalent power density

NOTE 1 TO TABLE 1: Occupational/controlled limits apply in situations in which persons are exposed as a consequence of their employment provided those persons are fully aware of the potential for exposure and can exercise control over their exposure. Limits for occupational/controlled exposure also apply in situations when an individual is transient through a location where occupational/controlled limits apply provided he or she is made aware of the potential for exposure.

NOTE 2 TO TABLE 1: General population/uncontrolled exposures apply in situations in which the general public may be exposed, or in which persons that are exposed as a consequence of their employment may not be fully aware of the potential for exposure or can not exercise control over their exposure.

[61 FR 41016, Aug. 7, 1996]

Results:

Refer to 9.1, the maximum average radiated power is 13.87 dBm = 24.38 mW
(at high frequency $T_{\min} / V_{\min} - V_{\max}$)

d = 20 cm

$$\rightarrow PD = 0.00485 \text{ mW/cm}^2$$

Limits:

FCC §1.1310 (B)

Frequency [GHz]	Power Density [mW / cm ²]
1.500 GHz – 100.000 GHz	1 mW / cm ²

Result: The measurement is passed.

9.4 Occupied bandwidth

Definition:

The width of the frequency band which is just sufficient such that, below the lower and above the upper frequency limits, the mean powers emitted are each equal to 0.5% of the total mean power of a given emission.

Measurement results:

Test conditions	99 % Occupied bandwidth [MHz]
low frequency (T_{nom} / V_{nom})	448.8
low frequency ($T_{min} / V_{min} - V_{max}$)	451.0
low frequency ($T_{max} / V_{min} - V_{max}$)	447.7
mid frequency (T_{nom} / V_{nom})	460.9
mid frequency ($T_{min} / V_{min} - V_{max}$)	452.1
mid frequency ($T_{max} / V_{min} - V_{max}$)	447.7
high frequency (T_{nom} / V_{nom})	448.8
high frequency ($T_{min} / V_{min} - V_{max}$)	452.1
high frequency ($T_{max} / V_{min} - V_{max}$)	447.7

Limits:

FCC §2.1049

Frequency range	$f(\text{lowest}) > 76.0 \text{ GHz}$	$f(\text{highest}) < 77.0 \text{ GHz}$

-----------------	---------------------------------------	--

Result: The measurement is passed.

10 Test equipment and ancillaries used for tests

Typically, the calibrations of the test apparatus are commissioned to and performed by an accredited calibration laboratory. The calibration intervals are determined in accordance with the DIN EN ISO/IEC 17025. In addition to the external calibrations, the laboratory executes comparison measurements with other calibrated test systems or effective verifications. Weekly chamber inspections and range calibrations are performed. Where possible, rf-generating and signalling equipment as well as measuring receivers and analyzers are connected to an external high-precision 10 MHz reference (GPS-based or rubidium frequency standard).

In order to simplify the identification of the equipment used at some special tests, some items of test equipment and ancillaries can be provided with an identifier or number in the equipment list below (Labor/Item).
