3 EUT specification

3.1 General description

The EUT, a data tag, model IG-DT-40-916, is a transceiver intended for automatic processing of secured cargoes and real time monitoring of cargoes in transit and in storage. The data tag is a stand-alone unit, it has two RF channels, high frequency and low frequency. The device operates at 916.5 MHz and at 125 kHz and is powered from 3.6 V lithium battery.

Local oscillator frequencies are: 32.768 kHz, 8 MHz, 26.641176 MHz and 28.64062 MHz.

3.2 EUT test configuration

The EUT test configuration is shown in Figure 3.2.1.

Figure 3.2.1 EUT test configuration

3.2.1 Changes made in EUT

To withstand the standard requirements the following changes were made in the EUT during the testing.

1. 100 pF capacitor C54 was replaced with 2.2 pF one.
2. 22 k Ω resistor R44 was replaced with 27 k Ω one.

It is manufacturer responsibility to implement the changes in the production version of the EUT. In any case the test report applies to the tested item only.

2400-2483.5	94
5275-5850	94
24000-24250	107.95

For frequencies above 1000 MHz, the above field strength limits are based on average limits.

TEST PROCEDURE

The EUT was tested, being placed on a wooden 80 cm height table in each of three orthogonal planes in turn.

To find maximum radiation the turntable was rotated 360°, measuring antenna height was changed from 1 to 4 m, and the antennas polarization was changed from vertical to horizontal.

METHOD OF MEASUREMENTS: ANSI 63.4 §13.1.4
DATE: October 21, 2002
RELATIVE HUMIDITY: 45 %

125.531	63.00	105.68	42.68	A2
Measurement uncertainty, dB		±4		

* The limit is based on measurements employing an average detector according to §15.209(d).

The 26 dB bandwidth was found to be 125.461 – 125.600 kHz, as demonstrated in Plots A3 and A4.

TEST EQUIPMENT USED:

88 - 216	43.5	3
216 - 960	46.0	3
Above 960	54.0	3

* F is frequency in kHz.

**The limit for 3 m distance was calculated using the inverse square distance extrapolation factor as follows:

$\text{Lim}S_2 = \text{Lim}S_1 + 40 \log(S_1/S_2)$, where $S_1 = 300$ m or 30 m, $S_2 = 3$ m.

At 124.8 kHz the limit was calculated:

$\text{Lim}_{3m} = 67.60 - 20 \log 124.8 + 40 \log (300/3) = 105.68 \text{ dB}(\mu\text{V/m})$

TEST PROCEDURE

The EUT was tested, being placed on a wooden 80 cm height table in each of three orthogonal planes in turn.

The loop antenna was positioned with its plane horizontal. The loop center was 1 meter above the ground plane. To find maximum radiation the turntable was rotated 360°. Then the loop position was changed to vertical. To find maximum radiation the turntable was rotated 360° and the measuring antenna was rotated about its vertical axis. Plots A2 to A4 in Appendix A refer to vertical antenna polarization as the worst case.

Appendix D General information

Test facility description

Tests were performed at Hermon Laboratories Ltd., which is a fully independent, private EMC, Safety and Telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47) and by Industry Canada for electromagnetic emissions (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), certified by VCCI, Japan (the registration numbers are R-808 for OATS, R-1082 for anechoic chamber, C-845 for conducted emissions site), assessed by TNO Certification EP&S (Netherlands) for a number of EMC, Telecommunications, Safety standards, and by AMTAC (UK) for safety of Medical Devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO/IEC 17025 for Electromagnetic Compatibility, Product Safety, Telecommunications Testing and Environmental Simulation (for exact scope please refer to Certificate No. 839.01).

Address: PO Box 23, Binyamina 30550, Israel.

Telephone: +972 4628 8001

Fax: +972 4628 8277

e-mail: mail@hermonlabs.com

Person for contact: Mr. Alex Usoskin, QA manager.
