**Description of equipment under test**

Test items	Electronic seal, FCC ID:OB6-IGSA21-01
Manufacturer	Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology
Brand Mark	Hi-G-Tek
Type (Model)	IG-SA-21, P/N TA3157
Trade Mark	Hi-G-Seal

Applicant information

Applicant's representative	Mr. Rony Cohen, chief engineer
Applicant's responsible person	Mr. Yossi Haimovich, VP R&D
Company	Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology
Address	16 Hacharoshet St.
P.O. Box	NA
Postal code	60375
City	Or-Yehuda
Country	Israel
Telephone number	011-972-3533 9359
Telefax number	011-972-3533 9225

Test performance

Project Number	13066
Location of the test	Hermon Laboratories, Binyamina, Israel
Test started	December 3, 1998
Test completed	December 6, 1998
Purpose of test	The EUT certification in accordance with CFR 47, part 2, §2.1033
Test specification(s)	FCC part 15, subpart C, §15.209

Through this report a point is used as the decimal separator and the thousands are counted with a comma.
This report is in conformity with EN 45001 and ISO GUIDE 25.
The test results relate only to the items tested.

1 General Information

1.1 Abbreviations and Acronyms

The following abbreviations and acronyms are applicable to this test report:

AC	alternating current
BW	bandwidth
dB	decibel
dBm	decibel referred to one milliwatt
dB(μ V)	decibel referred to one microvolt
dB(μ V/m)	decibel referred to one microvolt per meter
DC	direct current
EUT	Equipment Under Test
GHz	gigahertz
H	height
HL	Hermon Laboratories
HP	Hewlett Packard
Hz	hertz
IF	intermediate frequency
kHz	kilohertz
L	length
m	meter
mm	millimeter
MHz	megahertz
msec	millisecond
mW	milliwatt
NA	Not Applicable
NARTE	National Association of Radio and Telecommunications Engineers, Inc.
QP	quasi-peak (detector)
RBW	resolution bandwidth
RF	Radio Frequency
RE	radiated emission
RMS	root-mean-square
sec	second
V	volt

1.2 Specification References

CFR 47 part 15: October 1997	Radio Frequency Devices.
ANSI C63.2:06/1987	American National Standard for Instrumentation-Electromagnetic Noise and Field Strength, 10 kHz to 40 GHz-Specifications.
ANSI C63.4:1992	American National Standard for Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

1.3 EUT Description

The EUT, electronic active seal Hi-G-Seal, model IG-SA-21, is a part of Hi-G-Seal system, that enables sealing of containers and verifying of assets that need to be sealed against and monitored for any trail to tamper with them. The seal enables remote reading of recorded data. The seal is monitored by radio terminal that is a part of the Hi-G-Seal system. Every opening or closing of the seal is logged and can be remotely read. The data is read by using an RF communication link at a distance of up to 1 meter. Once the Hi-G-Seal is activated the seal generates a unique sealing stamp with date and time details. The sealing stamp with all details is saved in the seal memory, logged in the seal reader and stored in the database.

The seal contains a transceiver with a permanently attached antenna. Transmitted frequency is $250 \pm 1.5\%$ kHz, maximum transmitted power is 40 mW. The EUT is powered by 3.6 V battery.

1.4 Statement of Manufacturer

I, Yossi Haimovich, Vice President R&D of Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology, declare that active electronic Hi-G-Seal, model IG-SA-21, was tested on December 3, 6, 1998 by Hermon Laboratories and which this test report applies to, is identical of the equipment that will be marketed.

The term identical means identical within the variations that can be expected to arise as a result of quantity production technique.

Yossi Haimovich, Vice President R&D
Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology

Signature: Haimovich

Date: Jan. 5, 1999

2 Test Facility Description

2.1 General

Tests were performed at Hermon Laboratories, which is a fully independent, private EMC, Safety and Telecommunication testing facility. Hermon Laboratories is listed by the Federal Communications Commission (USA) for all parts of Code of Federal Regulations 47 (CFR 47), listed by Industry Canada for radiated measurements (file numbers IC 2186-1 for OATS and IC 2186-2 for anechoic chamber), recognized by VDE (Germany) for witness test, certified by VCCI (Japan), assessed by NMI Certin B.V. (Netherlands) for a number of EMC, Telecommunications and Safety standards, recognized by TUV Sudwest (Germany) for Safety testing, and Accredited by AMTAC (UK) for safety of Medical Devices. The laboratory is accredited by American Association for Laboratory Accreditation (USA) according to ISO GUIDE 25/EN 45001 for EMC, Telecommunications and Product Safety Information Technology Equipment (Certificate No. 839.01).

Address: PO Box 23, Binyamina 30550, Israel.
Telephone: +972-6-628-8001
Fax: +972-6-628-8277

Person for contact: Mr. Alex Usoskin, testing and QA manager.

2.2 Equipment Calibration

The test equipment has been calibrated according to its recommended procedures and is within the manufacturer's published limit of error. The standards and instruments used in the calibration system conform to the present requirements of MIL-STD-45662A. The laboratory standards are calibrated by the third party (traceable to NIST, USA) on a regular basis according to equipment manufacturer requirements.

2.2.1 Uncertainty in Hermon Labs Measurements.

Radiated Emissions (95% Confidence)	Biconical Antenna:
	3m measuring distance : + 4.06 dB Expanded uncertainty
	: - 3.98 dB Expanded uncertainty
	: + 2.032 dB Combined standard uncertainty
	: - 1.99 dB Combined standard uncertainty
	10m measuring distance : + 3.98 dB Expanded uncertainty
	: - 4.08 dB Expanded uncertainty
	: + 1.99 dB Combined standard uncertainty
	: - 2.04 dB Combined standard uncertainty
	Log periodic Antenna:
	3m measuring distance : + 4.74 dB Expanded uncertainty
	: - 3.26 dB Expanded uncertainty
	: + 2.37 dB Combined standard uncertainty
	: - 1.63 dB Combined standard uncertainty
	10m measuring distance : + 3.06 dB Expanded uncertainty
	: - 3.00 dB Expanded uncertainty

2.3 Laboratory Personnel

The two people of Hermon Laboratories that have participated in measurements and documentation preparation are: Mr. Michael Feldman, test technician and Mrs. Marina Cherniavsky - certification engineer.

M. Cherniavsky is a telecommunication engineer certified by the National Association of Radio and Telecommunications Engineers (NARTE, USA).

The Hermon Laboratories' personnel that participated in this project have more than 50 years combined experience time in EMC measurements and electronic products design.

2.4 Statement of Qualification

The test measurement data supplied in this test measurement report having been received by me, is hereby duly certified. The following is a statement of my qualifications:

I am a technician, have obtained 29 years experience in electronics and measurements.

I have been with Hermon Laboratories since 1995.

Name: Mr. Michael Feldman

Position: test technician

Signature: 

Date:

December 29, 1998

I hereby certify that this test measurement report was prepared by me and is hereby duly certified. The following is a statement of my qualifications.

I am an engineer, graduated from University in 1971, with an MScEE degree, have obtained 25 years experience in electronic products design and development and have been with Hermon Laboratories since 1991. Also, I am a Telecommunication Class II engineer certified by the National Association of Radio and Telecommunications Engineers, Inc. (USA.), the certificate no. is E2-03410.

Name: Mrs. Marina Cherniavsky

Position: certification engineer

Signature: 

Date:

December 29, 1998

3 Radiated Emission Measurements

3.1 Field Strength of Emissions according to § 15.209 (a)

3.1.1 Specified limit

Frequency, MHz	Field strength, microvolts/meter	Measurement distance, meters
0.009 – 0.490	2400/F(kHz)	300

3.1.2 Extrapolation (distance correction) factor

The test was performed in the anechoic chamber at 3 meter test distance, i.e. the distance between measuring antenna and EUT boundary. The results were extrapolated by using the square of an inverse linear distance factor DF:

$$DF = 40 \log (D_1/D_2) = 80 \text{ dB, where}$$

D_1 is the 300 meters specified measurement distance

D_2 is the 3 meters test measurement distance.

The DF=80 dB was applied for limit calculation at 3 m test distance measurements.

For 248 kHz frequency the calculated limit is:

$$\text{Limit}_{3\text{m}} = \text{Limit}_{300\text{m}} + DF = 19.6 \text{ dB}(\mu\text{V/m}) + 80 \text{ dB} = 99.6 \text{ dB}(\mu\text{V/m}).$$

3.1.3 Test Procedure and Results

The EUT was placed on the wooden turntable, as shown in Figure 3.1.1, Photographs 3.1.1, 3.1.2 and was operated in continuous modulated transmitting mode. During testing the EUT was positioned in three orthogonal axes and the measurements were performed with loop antenna. The center of the loop was 1 m above the ground. The frequency range from the lowest generated signal frequency up to 10th harmonic was investigated. To find maximum radiation the turntable was rotated 360°, the antenna was rotated about its vertical axis and the antenna polarization was changed from vertical to horizontal. The average detector was used. The test measurement results were recorded into Table 3.1.1 and are shown in Plot 3.1.1.

3.2 Unintentional Radiated emissions test

3.2.1 Definition of the test

This test was performed to measure radiated emissions from the receiver and incorporated digital device of the EUT and also to verify the EUT full compliance with §15.109, §15.209.

3.2.2 The test set-up configuration, Test Procedure and Results

The radiated emissions measurements of the EUT in receive mode and incorporated digital device were performed in the anechoic chamber at 3 meter measuring distance in the frequency range from 30 MHz to 1 GHz. The EUT was placed on the wooden table as shown in Figure 3.2.1. The biconilog antenna was used. To find maximum radiation the turntable was rotated 360°, the measuring antenna height changed from 1 to 4 m, and the antenna polarization was changed from vertical to horizontal.

The measurements were performed with the EMI receiver settings: RBW=120 kHz, peak and quasi peak detectors.

All the measured emissions were found at least 20 dB below Class A specified limit. The test measurement results are shown in Plot 3.2.1.

4. Summary and Signatures

The EUT, active Hi-G-Seal, was found to be in compliance with the FCC part 15 subpart B §15.109 class A and subpart C §15.209 limits.

Test performed by:

Mr. Michael Feldman, test technician

Approved by:

Dr. Edward Usoskin, C.E.O.

Responsible person from Hi-G-Tek Ltd. Microelectronics & Asset Tracking Technology

Mr. Yossi Haimovich, Vice President R&D
