

APPENDIX 2: SAR Measurement data

Appendix 2-1: Evaluation procedure

The SAR evaluation was performed with the following procedure:

Step 1: Measurement of the E-field at a fixed location above the central position of flat phantom was used as a reference value for assessing the power drop.

Step 2: The SAR distribution at the exposed side of head or body position was measured at a distance of each device from the inner surface of the shell. The area covered the entire dimension of the antenna of EUT and suitable horizontal grid spacing of EUT. Based on these data, the area of the maximum absorption was determined by splines interpolation.

Step 3: Around this point found in the Step 2 (area scan), a volume of 30mm(X axis)×30mm(Y axis)×30mm(Z axis) (or more) was assessed by measuring 7×7×7 points (or more) under 3GHz.
And for any secondary peaks found in the Step2 which are within 2dB of the SAR limit (1.6W/kg), this Step3 (Zoom scan) is repeated.

On the basis of this data set, the spatial peak SAR value was evaluated under the following procedure:

- (1) The data at the surface were extrapolated, since the center of the dipoles is 1mm away from the tip of the probe and the distance between the surface and the lowest measuring point is 2mm. The extrapolation was based on a least square algorithm. A polynomial of the fourth order was calculated through the points in z-axes. This polynomial was then used to evaluate the points between the surface and the probe tip.
- (2) The maximum interpolated value was searched with a straightforward algorithm. Around this maximum the SAR values averaged over the spatial volumes (1g or 10g) were computed by the 3D-Spline interpolation algorithm. The 3D-Spline is composed of three one-dimensional splines with the "Not a knot"-condition (in x, y and z-directions). The volume was integrated with the trapezoidal-algorithm. One thousand points (10×10×10) were interpolated to calculate the average.
- (3) All neighboring volumes were evaluated until no neighboring volume with a higher average value was found.

Step 4: Re-measurement of the E-field at the same location as in Step 1 for the assessment of the power drift.

Step 5: Repeat Step 1-Step 4 with other condition or/and setup of EUT.

The expiration date of calibration is the end of the expired month.

As for some calibrations performed after the tested dates, those test equipment have been controlled by means of an unbroken chains of calibrations.

All equipment is calibrated with valid calibrations. Each measurement data is traceable to the national or international standards.

[Test Item] SAR: Specific Absorption Rate, Ant.pwr: Antenna terminal conducted power

Appendix 3-2: Configuration and peripherals

These measurements were performed with the automated near-field scanning system DASY5 from Schmid & Partner Engineering AG (SPEAG). The system is based on a high precision robot, which positions the probes with a positional repeatability of better than ± 0.02 mm. Special E- and H-field probes have been developed for measurements close to material discontinuity, the sensors of which are directly loaded with a Schottky diode and connected via highly resistive lines to the data acquisition unit. The SAR measurements were conducted with the dosimetry probes EX3DV4 (manufactured by SPEAG), designed in the classical triangular configuration and optimized for dosimetric evaluation.

The DASY5 system for performing compliance tests consist of the following items:

1	A standard high precision 6-axis robot (Stäubli TX/RX family) with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
2	An isotropic field probe optimized and calibrated for the targeted measurement.
3	A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
4	The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
5	The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
6	The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
7	A computer running Win7 professional operating system and the DASY5 software.
8	R Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
9	The phantom.
10	The device holder for EUT. (low-loss dielectric palette) (*. when it was used.)
11	Tissue simulating liquid mixed according to the given recipes.
12	Validation dipole kits allowing to validate the proper functioning of the system.

Appendix 3-3: Test system specification**TX60 Lsepag robot/CS8Csepag-TX60 robot controller**

- Number of Axes : 6
- Repeatability : $\pm 0.02\text{mm}$
- Manufacture : Stäubli Unimation Corp.

DASY5 Measurement server

- Features : The DASY5 measurement server is based on a PC/104 CPU board with a 400MHz intel ULV Celeron, 128MB chip-disk and 128MB RAM. The necessary circuits for communication with the DAE4 electronics box, as well as the 16 bit AD converter system for optical detection and digital I/O interface are contained on the DASY5 I/O board, which is directly connected to the PC/104 bus of the CPU board.
- Calibration : No calibration required.
- Manufacture : Schmid & Partner Engineering AG

Data Acquisition Electronic (DAE)

- Features : Signal amplifier, multiplexer, A/D converter and control logic. Serial optical link for communication with DASY5 embedded system (fully remote controlled). 2 step probe touch detector for mechanical surface detection and emergency robot stop (not in -R version)
- Measurement Range : $1\mu\text{V}$ to $> 200\text{mV}$ (16bit resolution and 2 range settings: 4mV , 400mV)
- Input Offset voltage : $< 1\mu\text{V}$ (with auto zero)
- Input Resistance : $200\text{M}\Omega$
- Battery Power : $> 10\text{hr}$ of operation (with two 9V battery)
- Manufacture : Schmid & Partner Engineering AG

Electro-Optical Converter (EOC61)

- Manufacture : Schmid & Partner Engineering AG

Light Beam Switch (LB5/80)

- Manufacture : Schmid & Partner Engineering AG

SAR measurement software

- Item : Dosimetric Assessment System DASY5
- Software version : DASY52, V8.2 B969
- Manufacture : Schmid & Partner Engineering AG

E-Field Probe

- Model : **EX3DV4 (serial number: 3679)**
- Construction : Symmetrical design with triangular core. Built-in shielding against static charges. PEEK enclosure material (resistant to organic solvents, e.g., DGBE).
- Frequency : 10MHz to 6GHz, Linearity: $\pm 0.2\text{ dB}$ (30MHz to 6GHz)
- Conversion Factors : 2450, 5200, 5300, 5500, 5600, 5800MHz (Head and Body)
- Directivity : $\pm 0.3\text{ dB}$ in HSL (rotation around probe axis)
 $\pm 0.5\text{ dB}$ in tissue material (rotation normal to probe axis)
- Dynamic Range : $10\mu\text{W/g}$ to $> 100\text{ mW/g}$; Linearity: $\pm 0.2\text{ dB}$ (noise: typically $< 1\mu\text{W/g}$)
- Dimension : Overall length: 330mm (Tip: 20mm)
Tip diameter: 2.5mm (Body: 12mm)
Typical distance from probe tip to dipole centers: 1mm
- Application : High precision dosimetric measurement in any exposure scenario (e.g., very strong gradient fields). Only probe which enables compliance testing for frequencies up to 6GHz with precision of better 30%.
- Manufacture : Schmid & Partner Engineering AG

Phantom

- Type : **ELI 4.0 oval flat phantom**
- Shell Material : Fiberglass
- Shell Thickness : Bottom plate: $2 \pm 0.2\text{mm}$
- Dimensions : Bottom elliptical: $600 \times 400\text{mm}$, Depth: 190mm (Volume: Approx. 30 liters)
- Manufacture : Schmid & Partner Engineering AG

Device Holder

- ☒ Urethane foam
- ☒ KSDH-01: In combination with the ELI4, the Mounting Device enables the rotation of the mounted transmitter device in spherical coordinates. Transmitter devices can be easily and accurately positioned. The low-loss dielectric urethane foam was used for the mounting section of device holder.
- Material : POM
- Manufacture : Schmid & Partner Engineering AG

Appendix 3-4: Simulated tissue composition and parameter confirmation

Liquid type	Body
Model No.	MSL2450V2
Product No.	SL AAM 245 BA
Ingredient: Mixture (%)	Water:52-75%, DGBE:25-48%, NaCl:<1.0%
Manufacture	Schmid & Partner Engineering AG

*. The dielectric parameters were checked prior to assessment using the DAK3.5 dielectric probe kit.

Dielectric parameter measurement results (Body tissue)										
Date	Frequency [MHz] (Liquid)	Ambient	Temperature Liquid [deg.C.]		Liquid Depth [mm]	Parameters		Target value (*1)	Measured	ΔSAR(1g) [%] (*2)
			Before	After		Relative permittivity: ε _r	Conductivity: σ			
April 8, 2014	2450 (Body)	22.5deg.C /47%RH	21.6	21.6	(153)	ε _r [-]		52.7	52.02	+1.04
						σ [S/m]		1.95	1.980	+1.6
										-5 ≤ ε _r -meas ≤ 0
										0 ≤ σ-meas ≤ +5

*1. The target value is a parameter defined in Appendix A of KDB865664 D01. The dielectric parameters suggested for head and body tissue simulating liquid are given at 2000, 2450 and 3000MHz. As an intermediate solution, dielectric parameters for the frequencies between 2000- 2450 and 2450-3000 were obtained using linear interpolation.

Standard					Interpolated				
f (MHz)	Head Tissue		Body Tissue		f (MHz)	Head Tissue		Body Tissue	
	ε _r	σ [S/m]	ε _r	σ [S/m]		ε _r	σ [S/m]	ε _r	σ [S/m]
(1800-)2000	40.0	1.40	53.3	1.52	2412	39.27	1.766	52.75	1.914
2450	39.2	1.80	52.7	1.95	2437	39.22	1.788	52.72	1.938
3000	38.5	2.40	52.0	2.73	2462	39.18	1.813	52.68	1.967
					2402	39.29	1.757	52.76	1.904

*2. The coefficients are parameters defined in IEEE Std 1528-2013.

$$\Delta SAR(1g) = C_{\epsilon r} \times \Delta \epsilon_r + C_{\sigma} \times \Delta \sigma, C_{\epsilon r} = -7.854E-4 \times f^3 + 9.402E-3 \times f^2 - 7.242E-2 \times f + 0.206 / C_{\sigma} = 9.804E-3 \times f^3 - 8.661E-2 \times f^2 + 2.981E-2 \times f + 0.7829$$

*3. Refer to KDB865664 D01, item 2, Clause 2.6; "When nominal tissue dielectric parameters are recorded in the probe calibration data; for example, only target values and tolerance are reported, the measured ε_r and σ of the liquid used in routine measurements must be: ≤ the target ε_r and ≥ the target σ values and also within 5% of the required target dielectric parameters."

Appendix 3-5: System check results

Prior to the SAR assessment of EUT, the system check was performed to test whether the SRA system was operating within its target of ±10%. The System check results are in the table below. (*. Refer to Appendix 3-6 of measurement data.)

System check results														
Date	Freq. [MHz]	Liquid Type	Ambient	Liquid Temp. [deg.C.]			Liquid Depth [mm]	Dielectric parameter		Power drift [dB]	System check target & measured			
				Check	Before	After		ε _r [-]	σ [S/m]		SAR (1g) [W/kg]		Deviation [%]	Limit [%]
											Measured (*4)	Target		
April 8, 2014	2450	Body	22.5deg.C /40%RH	21.6	21.7	21.7	153	52.02	1.980	-0.00	50.27 (1W scaled)	none (*5)	-	-
											(12.7 (250mW)>ΔSAR-corrected:12.57)	50.0 (*6)	+1.6	±10

*. Calculating formula: ΔSAR corrected SAR (1g) (W/kg) = (Observed SAR(1g) (W/kg)) × (100 - (ΔSAR(%)) / 100

$$\text{Reported SAR (1g) (W/kg)} = (\text{Observed SAR(1g) (W/kg)}) \times (\text{Scaled factor (-)})$$

*4. The measured SAR value of system check was compensated for tissue dielectric deviations (delta-SAR) and scaled to 1W of output power in order to compare with the manufacture's calibration target value which was normalized.

*5. The target value (normalized to 1W) is defined in IEEE Std.1528.

*6. The target value is a parameter defined in the calibration data sheet of D2450V2 (sn:822) dipole calibrated by Schmid & Partner Engineering AG (Certification No. D2450V2-822 Jan14, the data sheet was filed in this report). For 2.45GHz, the manufacture's calibration data of dipole for head liquid were within 1% of IEEE Std 1528 head liquid target value (=52.4W/kg, cal=52.8W/kg, +0.8% vs. standard). This calibration result is enough, using this dipole as a reference. We decided to use body liquid calibration data of this dipole for the system check target.

Test setup for the system performance check

Appendix 3-6: System check measurement data**(April 8, 2014) EUT: Dipole(2.45GHz); Type: D2450V2; Serial: 822; Forward conducted power: 250mW****Communication System: CW;** Communication System Frame Length in ms: 0; Communication System PAR: 0; PMF: 1**Frequency: 2450 MHz; Crest Factor: 1.0****Medium: M2450; Medium parameters used: $f = 2450$ MHz; $\sigma = 1.98$ S/m; $\epsilon_r = 52.017$; $\rho = 1000$ kg/m³**
