6. Measuring Methods

6.1. Maximum Transmitter Power (CFR47 §90.217, §2.1046 / IC RSS-119 sections 6.2 and 6.7)

The maximum transmitter power was measured radiated and, if applicable, conducted at antenna connector.

6.1.1. Conducted Maximum Transmitter Power

A spectrum analyzer / EMI test receiver was connected to the antenna connector (conducted measurement) while EUT was operating in transmit mode using the assigned frequency.

The trace mode of the spectrum analyzer was set to max hold with:
RBW = 100 kHz, VBW = 100 kHz, span = 1 MHz, sweep = 20 ms (auto mode)

See figure 1 for the measurement setup.

Test equipment used (see equipment list for details):
02, 18, 51, 69

6.1.2. Radiated Maximum Transmitter Power

Radiated Maximum Transmitter Power was measured with detector-function of the spectrum analyzer set to positive peak and trace mode max hold:

RBW = 100 kHz, VBW = 100 kHz, span = 1 MHz, sweep = 15 s

For measurement setup and procedure see section "Unwanted Emission " on Page 13.

6.2. Frequency tolerance (CFR47 §90.217, §2.1055 / IC RSS-119 sections 6.7 and 7.0)

6.2.1. Frequency stability vs. temperature

The frequency stability vs. temperature was measured with a spectrum analyzer connected to the antenna connector (conducted measurement) while EUT was operating in transmit mode using the assigned frequency.

The trace mode of the spectrum analyzer was set to write with frequency count mode activated:

RBW = 100 Hz, VBW = 100 Hz, span = 20 kHz, sweep = 1.5 s (auto mode)

See figure 2 for the measurement setup.

Test equipment used (see equipment list for details):
02, 18, 51, 54, 69

6.2.2. Frequency stability vs. supply voltage

The frequency stability vs. supply voltage was measured with a spectrum analyzer connected to the antenna connector (conducted measurement) while EUT was operating in transmit mode using the assigned frequency.

The trace mode of the spectrum analyzer was set to write with frequency count mode activated:

RBW = 100 Hz, VBW = 100 Hz, span = 20 kHz, sweep = 1.5 s (auto mode)

See figure 2 for the measurement setup.

Test equipment used (see equipment list for details):
02, 18, 51, 69, 70, 71

6.3. Occupied Bandwidth (CFR47 §90.217, §2.1049)

The emission bandwidth was measured as occupied bandwidth with a spectrum analyzer connected to the antenna connector (conducted measurement) while EUT was operating in transmit mode using the assigned frequency.

The occupied bandwidth measurement was performed referring to 99% of total power:
The trace mode of the spectrum analyzer was set to max hold with
RBW = 100 Hz, VBW = 100 Hz, span = 40 kHz, sweep = 3 s (auto mode)

See figure 1 for the measurement setup.

Test equipment used (see equipment list for details):
02, 18, 51, 69, 70, 71

6.4. Unwanted Emission (CFR47 §90.217, §2.1051 / IC RSS-119 sections 6.4 and 6.7)

Unwanted emission was measured radiated and, if applicable, conducted at antenna connector.

6.4.1. Conducted Unwanted Emission

Conducted emissions were measured over the frequency range from 30 MHz to 5 GHz. A spectrum analyzer / EMI test receiver was connected to the antenna connector (conducted measurement) while EUT was operating in transmit mode using the assigned frequency.

The trace mode of the spectrum analyzer was set to max hold with:
 $f < 1$ GHz: RBW = 30 kHz, VBW = 30 kHz, span as required, sweep = auto mode
 $f \geq 1$ GHz: RBW = 1 MHz, VBW = 1 MHz, span as required, sweep = auto mode

See figure 1 for the measurement setup.

6.4.2. Radiated Unwanted Emission

Radiated emissions were measured over the frequency range from 30 MHz to 5 GHz. For final testing the detector-function of the spectrum analyzer was set to positive peak and trace mode max hold:

$f < 1$ GHz: RBW = 30 kHz, VBW = 30 kHz, span as required, sweep = auto mode
 $f \geq 1$ GHz: RBW = 1 MHz, VBW = 1 MHz, span as required, sweep = auto mode

Measurements were made in both the horizontal and vertical planes of polarization. The scans were taken in a fully-anechoic room using a spectrum analyzer with the detector function set to peak and resolution bandwidth set to 30 kHz. All tests were performed at a test-distance of 3 meters. Hand-held or body-worn devices are rotated through three orthogonal axes to determine which attitude and configuration produces the highest emission relative to the limit and therefore shall be used for final testing. During the tests the EUT was rotated all around to find the maximum levels of emissions. The cables and equipment were placed and moved within the range of position likely to find their maximum emissions.

Final testing was performed referring to substitution method as described in TIA/EIA-603, section 2.2.12 ("Radiated Spurious Emissions").

For recording the emission mask the detector-function of the spectrum analyzer was set to positive peak and trace mode max hold with the following settings:
RBW = 300 Hz, VBW = 300 Hz, span as required, sweep = auto mode

See figure 3 for the measurement setup.

Test equipment used (see equipment list for details):
01, 06, 12, 15, 38, 39, 40, 41, 55, 58, 61, 64, 66

For details on occupied bandwidth see plot on following page. To demonstrate compliance with the emission mask the bandwidth required for frequency stability has to be included into the calculations.

	Frequency (MHz)	Attenuation (dB)	Frequency tolerance (kHz)	Calculated frequency (MHz)	Assigned frequency (MHz)	Frequency mask (kHz)	Limit (MHz)

12. Additional Information supplementary to the Test Report

12.1. Calculation of the necessary bandwidth (Section 2.202b)

Calculation	$B_n = 2M + 2DK$
M = Modulation frequency	M = 1.8 kHz
D = Peak deviation	D = 2.0 kHz
K = Overall numerical factor	K = 1
	$B_n = 2 \cdot (1.8 \text{ kHz}) + 2 \cdot (2.0 \text{ kHz}) \cdot 1 = 7.6 \text{ kHz}$
Type of Emission	7K60F1D
