731 Confirmation No. EA93783  
Correspondence Reference No.: 7926  
Original Date of E-Mail: 5/25/99

Mr. Czumak:

Item 1 of your original e-mail is addressed in Section 1.2 on Page 3 of the Technical Manual.

Item 2 of your original e-mail is addressed in Section 2.2.1 on Pages 4 and 5 of the Technical Manual.

**MANUFACTURER'S NOTE:**

The Model 1225 Transceiver is sold exclusively to Federal and State law Enforcement personnel by ATS without use of secondary agents or re-sellers. As such, ATS has direct control over the "end user group". The radios are typically used to monitor transmissions from other devices. The transmit capability of the radios are typically used less than 10% over an 8 hour period with the transmission usually being of short durations (30 seconds). Further, the radio microphone is sensitive and is designed so the radio can be held away from the face when using it for transmitting.

A Technical Manual (Operators Manual) is provided with the equipment. The Manual has been modified to address proper operation and antenna usage. Training is also provided and will address proper use of the radio, ie "hold the radio away from the face when transmitting" and a SAR reference. Training materials are also provided to the attendees. Copies of the revised manual and training materials are provided.

The antenna connector used is non-standard. It is a panel mounted SMA with a special locking nut on the outside (user side) that forms a cup. The antenna must fit within the cup in order to screw down properly onto the connector.

Sincerely,  
Bruno Clavier
