1.3 Product Description

The mid-power remote expansion unit (MxU) is a new addition to the Corning® optical network evolution (ONE™) solution mid-power product line which enables medium power transmission for the 2.5 GHz band (TDD). The MxU is a 1U add-on unit that enhances the scalable multiservice MRU solution, adding additional service support at a relatively low cost.

The MxU expands the MRUs service distribution at remote locations to include the 2.5 GHz LTE (TDD) band, enabling up to eight operator services (with the MRU) to be distributed over a single broadband infrastructure.

The MxU interfaces to the MRU, providing broadband frequency support over UL/DL RF expansion ports. It supports the 2.5 GHz frequency band in a single enclosure and includes a future option for connecting additional add-on units for even more band support. All eight services are distributed over the same infrastructure: routed to the MRU over a single optic fiber, distributed over the same footprint and managed as a single element via a web session to the headend control module (HCM) — as the MRU.

1.4 Test Methodology

Both conducted and radiated testing were performed according to the procedures in KDB 971168 D03 v01 and KDB 935210 D05 v01r01. Radiated testing was performed at an antenna to EUT distance of 3 meters.

1.5 Test Facility

Both conducted and radiated emissions tests were performed at I.T.L.'s testing facility in Lod, Israel. I.T.L.'s EMC Laboratory is accredited by A2LA, certificate No. 1152.01 and its FCC Designation Number is IL1005.

2. System Test Configuration

2.1 *Justification*

The test setup was configured to closely resemble the standard installation.

The EUT consists of the MXU (Mid-Power TDD Add-On Remote Module) which is connected with the MRU. Both MRU and MXU are connected with head-end ONE equipment using fiber optic cable.

The RF source signals are represented in the setup by appropriate signal generators.

An “Exercise” SW on the computer was used to enable/disable transmission of the EUT, while the EUT output was connected to the spectrum analyzer.

The system was tested under maximum gain conditions.

2.2 *EUT Exercise Software*

SW version - 3.1 build 11

Firmware version - mxu_ab64_31_35.bin

2.3 *Special Accessories*

No special accessories were needed in order to achieve compliance.

2.4 *Equipment Modifications*

No modifications were needed in order to achieve compliance.

4.1 Test Specification

FCC Part 27, Subpart C, Section: 27.50(h)(1)(i)

4.2 Test Procedure

(Temperature (22°C)/ Humidity (35%RH))

The E.U.T. antenna terminal was connected to the Spectrum Analyzer through an external attenuator and an appropriate coaxial cable (loss=41.0dB). The E.U.T. RF output was modulated with QPSK, 16QAM and 64QAM, at 10.0 MHz BW. Special attention was taken to prevent Spectrum Analyzer RF input overload.

4.3 Test Limit

The maximum EIRP of a main, booster or base station shall not exceed 33 dBW + 10log(X/Y) dBW, where X is the actual channel width in MHz and Y is either 6 MHz if prior to transition or the station is in the MBS following transition or 5.5 MHz if the station is in the LBS and UBS following transition. The limit is calculated to be: $63 + 10 \log (10 \text{ MHz}/12 \text{ MHz}) = 62.2 \text{ dBm}$.
