1 EUT Details

1.1 General

The EUT was a DataLogic OM6010-R which forms part of a cordless bar code reader system. The unit acts as a base station receiving data via a radio link to a cordless bar code reader (DataLogic DLL6000-R series). The OM6010-R also acts as an interface to peripheral equipment such as a personal computer. The radio link operates at 910MHz.

The device was therefore considered as an intentional radiator (CFR47 part 15 sub-section C - section 15.249) and also as a class A digital device.

The unit is powered via an external power adapter. The unit also functions as a battery charger for the cordless bar code readers.

The EUT has a single port for connection to a PC. This port may be configured for a different types of interface and was tested as a serial interface and a 'wedge' interface (connects between PC and keyboard).

Although the EUT also has two ports for connection to a Field Bus interface this feature is not supported on this version of the unit. Further tests will be made on the unit with this option at a later date.

Details of the EUT and associated peripherals used during the tests are listed below. Figure 1 shows the interconnections between the EUT and peripherals.

Item	Manufacturer	Model	Description	Serial No:	Notes
1	Datalogic	OM6010R	Cradle	098N05041	OMJ0001
2	Datalogic	DLL6110-R-NM	EUT with display	C90E09730	OMJ0000
3	DataLogic	PG11/DVE	ac adaptor	A9909	N/A
4	Dell	SYS 210	Computer	SYS210031921	E2K50YDELL210
5	Hewlett Packard	Deskjet 850C	Printer	SG563160GC	B94C2145X

1.2 Modifications to EUT and Peripherals

Details of any modifications that were required to achieve compliance are listed below. The modification numbers are referred to in the results sections as appropriate.

Mod No:	Details
1	L10 changed to 100R resistor in order to reduce radio transmit level.

1.3 EUT Operating Modes

The EUT was tested in the following operating mode or modes. Generally, operating modes are chosen that will exercise the functions of the EUT as fully as possible and in a manner likely to produce maximum emission levels or susceptibility. Individual test result sheets reference the operating mode of the EUT.

Operating Mode	Details
1	Normal operating mode with processors fully active waiting for radio signal from remote bar code reader. Serial connection to PC.
2	As mode 1 with 'wedge' connection to PC via keyboard interface.
3	Set to test mode which permanently activates radio transmitter.
4	Gun located in cradle with battery charging.

Figure 1: General Arrangement of EUT and Peripherals - with serial connection

- | | | | |
|----|--|---------|-------|
| #1 | screened | printer | cable |
| #2 | 1.5m screened keyboard cable | | |
| #3 | 1.5m screened video cable | | |
| #4 | 1m unscreened power cable | | |
| #5 | 1.5m unscreened cable from cradle to serial port | | |
| #6 | 1.5m screened mouse cable | | |
| #7 | 1.5m unscreened power cable | | |

Note: this set up was used only for conducted emissions with the EUT charging the gun. Radiated emissions were measured in normal operating mode with the gun removed from the cradle.

3 Test Methods

3.1 Conducted Emissions - ac power

This section describes the general method of performing this test. The specific method used and any deviations from this general method are listed in the appropriate results section.

Bench top EUTs and peripheral equipment are normally placed on a 0.8m high non-conducting bench, positioned 0.4m from one of the metallic walls of a screened room. Floor standing EUTs are normally placed 0.1m above the metallic floor of the screened room. Mains leads are bundled so as not to exceed 1m.

The EUT is powered using a 50ohm/50uH Line Impedance Stabilisation Network (LISN). Peripherals are powered using a second a 50ohm/50uH LISN. These LISNs are bonded to the screened room floor.

With the correct supply voltage applied to the EUT scans are performed on both the live and neutral line outputs of the LISN using quasi-peak detection over the specified frequency range. The results of these scans are shown in the plots section at the end of the report.

Significant emissions identified by the scans are measured and the results tabulated. The table of results is shown in the conducted emissions results section.

3.4 Radiated Emissions

This section describes the general method of performing this test. The specific method used and any deviations from this general method are listed in the appropriate results section.

Initial scans are performed in a semi-anechoic screened room at a distance of 3m. Scans are performed over the frequency range 30MHz to 1GHz with the antenna both horizontally and vertically polarised. During these scans the EUT and peripherals are rotated through 360°. Bench top EUTs are placed on a non-conducting bench at a height of 0.8m above the ground plane. Floor standing EUTs are placed 0.1m above the ground plane. The results of the scans are shown in the plots included at the end of the report.

Significant emissions identified by the scans are measured on an open area test site at the appropriate test distance using a CISPR16 quasi-peak receiver. Maximised readings are obtained by rotating the EUT through 360° and adjusting the height of the antenna from 1m to 4m. Measurements are made with the antenna both horizontally and vertically polarised and the results tabulated.

4 Test Results

The following sections contain tabulated test results. Plots of various scans are included at the back of this section.

Frequency List (MHz)
