

Electromagnetic Emission

FCC MEASUREMENT REPORT

VERIFICATION OF COMPLIANCE FCC Part 90 Certification Measurement

PRODUCT : VHF-FM Handheld Transceiver
MODEL/TYPE NO : AT-100A
FCC ID : ONKAT100A
APPLICANT : Airtech Information & Communications Co.,Ltd.
#101-807, Techno Park Complex. , 364, Samjung-dong,
Ojung-ku, Buchon-si, Kyungki-do, 421-809, Korea
Attn. : T.H. Myung / General Manager
FCC CLASSIFICATION : Non-Broadcast Transmitter Held to Face(TNF)
FCC RULE PART(S) : FCC Part 90 Private Land Mobile Radio Services
FCC PROCEDURE : Certification
TRADE NAME : Airtech
TEST REPORT No. : E01.0825.FCC.255N
DATES OF TEST : August 20 ~25, 2001
DATES OF ISSUE : August 25, 2001
TEST LAB. : ETL Inc
371-51, Gasan-Dong, Geumcheon-Gu, Seoul, Korea
Tel : (031) 885-0072 Fax : (031) 885-0074

This VHF hand held FM transceiver has been tested in accordance with the measurement procedures specified in ANSI/TIA/EIA-603-1992 and Part 2(refer to the test report) at the ETL/EMC Test Laboratory and has been shown to be complied with the electromagnetic radiated emission limits specified in FCC Rule Part 2 & 90 requirement.

I attest to the accuracy of data. All measurement herein were performed by me or were made under my supervision and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

The results of testing in this report apply to the product/system which was tested only. Other similar equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties.

2. INTRODUCTION

The measurement tests were conducted at the open area test site of E-RAE Testing Laboratory Inc. facility located at 584, Sangwhal-ri, Ganam-myun, Youju-kun, Kyongki-do, Korea. The measurement facilities were constructed in conformance with the requirements of the ANSI C63.4-1992 and CISPR Publication 16. The ETL has site descriptions on file with the FCC for 3 and 10 meter site configurations. Detailed description of test facility was found to be in compliance with the requirements of Section 2.948 FCC Rules according to the ANSI C63.4-1992 and registered to the Federal Communications Commission(Registration Number : 95422).

All measurements contained in this application were conducted in accordance with FCC Rules and regulations CFR 47 and American National Standard Method of Measurement of Radio-Noise Emission from Low-Voltage Electrical and Electronic Equipment in the Range of 9kHz to 40GHz (ANSI C.63.4-1992).

Measurement Procedure

The radiated and spurious measurements were made outdoors at a 3-meter test range (see Figure2). The equipment under testing was placed on a wooden turntable, 3-meters from the receive antenna. The receive antenna height and turntable rotations was adjusted for the highest reading on the receive spectrum analyzer. A half-wave dipole was substituted in place of the EUT. This dipole antenna was driven by a signal generator and the level of the signal generator was adjusted to obtain the same receive spectrum analyzer reading. This level was recorded. For readings above 1 GHz, the above procedure would be repeated using horn antennas and the difference between the gain of the horn and an isotropic antenna are taken into consideration.

3. DESCRIPTION OF APPENDIX

Attachment A. Cover Letters

- Application request letter
- Agency Authorization letter

Attachment B. Attestation Statements

- Part 90 attestation statement

Attachment C. Test Report

- EMC Measurement report

Attachment D. FCC ID Label and Location

- Sample FCC ID Label and location information is shown

Attachment E. Test Setup Photos

- Radiated Emission Test setup photos are shown

Attachment F. External Photos

- External photos of AT-400B are shown

Attachment G. Internal Photos

- Internal photos of AT-400B are shown

Attachment H. Block Diagram

- The block diagram is shown

Attachment I. Schematics

- The circuit diagrams are shown

Attachment J. Operational Instruction

- Explanation of operational instruction for circuit is shown.

Attachment K. Part List / Tune up Procedure

- The part lists and alignment procedure are shown.

Attachment L. User Manual

- The user operating manual is shown.

Attachment M. SAR Measurement report

- The block diagram is shown

4. DESCRIPTION OF TESTS

4.1 RF Power Output - Conducted Power Output - §2.1046

Test Procedure : ANSI/TIA/EIA-603-1992, section 2.2.1

The EUT was connected to a resistive coaxial attenuator having a 50 ohm load impedance, and the unmodulated RF output power(carrier) was measured by means of an R. F. Spectrum Analyzer.

The EUT was aligned for transmitter operation on three frequencies(F_o) at full rated power per the tune-up procedure outlined in the Product Specification. This represents frequencies at the low, middle and high end of the EUT operating frequency band.

4.2 RF Power Output – ERP Measurement by Substitution Method - §2.1046

The EUT was setup at an antenna to EUT distance of 3 meters on an open area test site. The EUT was placed on a nonconductive turntable approximately 0.8 meters above the ground plane.

The physical arrangement of the EUT and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. At each frequency, the EUT was rotated 360 degrees, and the antenna was raised and lowered from one to four meters in order to determine the maximum emission levels.

Measurements were taken using both horizontal and vertical antenna polarizations.

The worst-case, maximum radiated emission was recorded and used as reference for the ERP measurement. The EUT was then replaced by an $\frac{1}{2}$ wave dipole antenna and polarized in accordance with the EUT's antenna polarization. The $\frac{1}{2}$ wave dipole antenna was connected to a RF signal generator with a coaxial cable.

The search antenna height, and search antenna polarity was set to levels that produced the maximum reading obtained in step 3. The signal generator was adjusted to a level that produced the radiated emission level obtained in step 3.

The signal generator level was recorded and corrected by the power loss in the cable between the generator and the antenna and further corrected for the gain of the substitution antenna used relative to an ideal $\frac{1}{2}$ wave dipole antenna. The signal generator corrected level is the ERP level

4. DESCRIPTION OF TESTS

4.3 Transmitter Audio Frequency Response - §2.1047(a)

Test Procedure : ANSI/TIA/EIA-603-1992, section 2.2.6

The audio frequency response is the degree of closeness to which the frequency deviation of the transmitter follows a prescribed characteristic. The frequency response of the audio modulating circuit over the frequency range 100 - 5000 Hz is measured. The audio signal generator is connected to the audio input circuit/microphone of the EUT. The audio signal input is adjusted to obtain 20% modulation at 1kHz and this point is taken as the 0dB reference level. With the input held constant and below the limit at all frequencies, the audio signal generator is varied from 100 Hz to 50 kHz. The deviation in kHz was recorded using a modulation analyzer. The response in dB relative to 1 kHz was calculated as follows:

Audio Frequency Response = $20 \text{ LOG } (\text{DEV}_{\text{freq}} / \text{DEV}_{\text{ref}})$

4.4 Audio Low Pass Filter Frequency Response - §2.1047(a)

Test Procedure : ANSI/TIA/EIA-603-1992, Section 2.2.15

The Audio Low Pass Filter Response is the frequency response of the post limiter low pass filter circuit above 3000 Hz. The response in dB relative to 1kHz is measured using the HP8901 Modulation Analyzer. For the frequency response of the audio low-pass filter, The EUT and test equipment were set up such that the audio input is connected at the input to the modulation limiter and the modulated stage. The audio output is connected at the output of the modulated stage.

4.5 Modulation Limiting - §2.1047(b) & §22.915(b)

Test Procedure : ANSI/TIA/EIA-603-1992, section 2.2.3

The audio signal generator is connected to the audio input circuit/microphone of the EUT.

The transmitter is adjusted its full rating. The modulation response is measured for each of the three modulating frequencies, one of them is the frequency of maximum response (300Hz, 1000 Hz, and 3000Hz), and the input signal voltage is varied from 30% modulation to at least 20dB higher than the saturation point. The system maximum deviation was recorded at each test condition.

Measurements of modulation and test plots are attached. Measurements were performed for both negative and positive modulation and respective results were recorded.

4. DESCRIPTION OF TESTS

4.6 Occupied Bandwidth : §2.1049

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission.

The antenna output terminal of the EUT was connected to the input of a 50ohm spectrum analyzer through a matched 30dB attenuator. The radio transmitter was modulated by a 2500 Hz tone at an input level 16 dB greater than that necessary to produce 50 percent modulation. The input level shall be established at the frequency of maximum response of the audio modulating circuit. The occupied bandwidth data is obtained for 25kHz and 12.5 kHz channel bandwidth. The results are shown on the attached graphs.

Specified limits according to the emission mask per section 90.210 is as below.

Emission Mask B. The power of any emission must be below the unmodulated carrier power (P) as follows:

- (1) On any frequency removed from the assigned frequency by more than 50 percent, but not more than 100 percent of the authorized bandwidth: At least 25 dB.
- (2) On any frequency removed from the assigned frequency by more than 100 percent, but not more than 250 per-cent of the authorized bandwidth: At least 35 dB.
- (3) On any frequency removed from the assigned frequency by more than 250 percent of the authorized band-width: At least $43 + 10 \log (P)$ dB.

Emission Mask D. For transmitters designed to operate with a 12.5 kHz channel bandwidth, any emission must be attenuated below the power (P) of the highest emission contained within the authorized bandwidth as follows:

- (1) On any frequency from the center of the authorized bandwidth f_0 to 5.625 kHz removed from f_0 : Zero dB.
- (2) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 5.625 kHz but no more than 12.5 kHz: At least $7.27(f_d \cdot 2.88 \text{ kHz})$ dB.
- (3) On any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in kHz) of more than 12.5 kHz: At least $50 + 10 \log (P)$ dB or 70 dB, whichever is the lesser attenuation.

4. DESCRIPTION OF TESTS

4.7 Spurious and Harmonic Emissions at Antenna Terminal : §2.1051

The level of the carrier and the various conducted spurious and harmonic frequencies is measured by means of a calibrated spectrum analyzer. The spectrum is scanned from the lowest frequency generated in the equipment up to 10 GHz. The transmitter is modulated with a 2500Hz tone at a level of 16dB greater than that required to provide 50% modulation of the rated system deviation at 1000 Hz.

The antenna output terminal of the EUT was connected to the input of 50 ohm spectrum analyzer through a matched 30dB RF attenuator and coaxial cable. The transmitter was operating at maximum power with modulation.

4.8 Radiated Spurious and Harmonic Emissions : §2.1053

Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or inter-mediate circuit elements under normal conditions of installation and operation.

Radiation and harmonic emissions above 1 GHz is measured outdoors at our 3-meter test range. The equipment under test is placed on a wooden turn-table 3meters from the receive antenna. The receive antenna height and turntable rotations were adjusted for the highest reading on the receive spectrum analyzer. A half-wave dipole was substituted in place of the EUT. This dipole antenna was driven by a signal generator with the level of the signal generator being adjusted to obtain the same receive spectrum analyzer reading. This level is recorded. For readings above 1GHz, the above procedure is repeated using horn antennas and the difference between the gain of the horn and an isotropic antenna are taken into consideration.

4. DESCRIPTION OF TESTS

4.9 Frequency Stability / Temperature Variation - §2.1055(b) & §22.915(b)

Test Procedure : ANSI/TIA/EIA-603-1992, section 2.2.2

The carrier frequency stability is the ability of the transmitter to maintain an assigned carrier frequency. The frequency stability of the transmitter is measured by:

- a) **Temperature:** The temperature is varied from -30°C to +50°C using an environmental chamber.
- b) **Primary Supply Voltage:** The primary supply voltage is varied from 85% to 115% of the voltage normally at the input to the device or at the power supply terminals if cables are not normally supplied.

Specification – The minimum frequency stability shall be +/- 2.5ppm for 12.5kHz channel bandwidth and 5ppm for 25kHz channel bandwidth at any time during normal operation.

Time Period and Procedure:

1. The carrier frequency of the transmitter and the individual oscillators is measured at room temperature (25°C to 27°C to provide a reference).
2. The equipment is subjected to an overnight "soak" at -30°C without any power applied.
3. After the overnight "soak" at 30°C (usually 14-16 hours), the equipment is turned on in a "standby"

condition for one minute before applying power to the transmitter. Measurement of the carrier frequency of the transmitter and the individual oscillators is made within a three minute interval after applying power to the transmitter.

4. Frequency measurements is made at 10°C interval up to room temperature. At least a period of one and one half hour is provided to allow stabilization of the equipment at each temperature level.
5. Again the transmitter carrier frequency and the individual oscillators is measured at room temperature to begin measurement of the upper temperature levels.
6. Frequency were made at 10 intervals starting at 30°C up to +50°C allowing at least two hours at each temperature for stabilization. In all measurements the frequency is measured within three minutes after applying power to the transmitter.
7. The artificial load is mounted external to the temperature chamber.

NOTE: The EUT is tested down to the battery endpoint.

4. DESCRIPTION OF TESTS

4.10 Transient Frequency Behavior - § 90.214

Test Procedure : ANSI/TIA/EIA-603-1992, section 2.2.19

1. The EUT was setup as shown on the following configuration.
2. The transmitter was turned on.
3. Sufficient attenuation was provided so that the transmitter carrier level measured at the output of the combiner was 40 dB below the maximum input level of the test receiver , then the transmitter was turned off.
4. With the transmitter off, an RF signal generator (1) modulated with a 1 kHz tone at 25kHz and 12.5 kHz deviation, and set to the same frequency as the assigned transmitter frequency, (2) was adjusted to a level -20 dB below the level recorded for step 3, as measured at the output of the combiner. This level was then maintained through out the test and was recorded.
6. The oscilloscope was setup using TIA/EIA-603 steps j and k as a guide, and to either 10 ms/div (UHF) or 5 ms/div (VHF).
7. The 30 dB attenuator was removed, the transmitter was turned on, and the level of the carrier at the output of the combiner was recorded.
8. The carrier on-time and the carrier off-time as referenced in TIA/EIA-603 steps were captured and plotted.

5. TEST DATA

5.1 RF Power Output : FCC Rules Part 2 §2.1046(a) , §90.205

A. Conducted Power Output

Transmitter Channel Setting	Frequency Tuned (MHz)	Measured Power (Peak) (dBm)	Rated Power (Watts)
Lowest	136.025	37.0	5.0
Middle	143.025	37.4	5.5
Highest	152.025	37.2	5.3

B. ERP Measurement by Substitution Method

Frequency Tuned (MHz)	EUT Conducted Power (dBm)	Max. E-Field of EUT (dBm)	Antenna Polarization (V/H)	Signal GEN. Power (dBm)	Dipole Gain (dBd)	Measured ERP Power	
						(dBm)	Watts
136.025	37.0	10.0	V	36.7	-0.45	36.25	4.2
143.025	37.4	11.2	V	36.9	-0.55	36.35	4.3
152.025	37.2	11.0	V	36.2	-0.45	35.75	3.8

Note :

1. Transmitter was set to the high power output(5 watts) condition.
2. The EUT antenna as specified by the manufacturer was used(unity gain).
3. The maximum measured ERP is 36.4 dBm(4.4 Watts), as recorded in the above table.
4. ERP measurements were performed using the standard battery with full charged condition.

5. TEST DATA

5.2 Modulation Characteristics – Audio Frequency Response

FCC Rules : Part 2 §2.1047(a)
 Operating Frequency : 143.025 MHz
 Channel : Middle
 Referency Voltage : 7.2 VDC
 Power Output : 5 Watts

Audio Frequency (Hz)	Response dB Measured	
	(Channel spacing : 12.5kHz)	(Channel spacing : 25kHz)
300	-13.0	-14.2
400	-10.2	-12.0
500	-8.8	-8.2
600	-6.4	-5.8
700	-3.4	-3.4
800	-1.8	-2.0
900	-0.8	-1.2
1000	0.0	0.0
2000	5.6	4.6
2500	6.8	7.2
3000	5.0	4.6
4000	-9.0	-8.6
5000	-19.0	-18.0

NOTE :

1. No limit is required by the FCC for audio frequency response. The mrasured audio response data shows the role-off curve at 3 kHz.

5. TEST DATA

5.2 Modulation Characteristics – Audio Frequency Response (continued)

5. TEST DATA

5.3 Modulation Characteristics – Audio Lowpass Filter Response

FCC Rules :	Part 2 §2.1047(a) , §90.242(b)(8)
Operating Frequency :	143.025 MHz
Channel :	Middle
Referency Voltage :	7.2 VDC
Power Output :	5 Watts

Audio Frequency (KHz)	Response dB Measured	
	(Channel spacing : 12.5kHz)	(Channel spacing : 25kHz)
1	0.0	0.0
2	1.2	1.0
3	-3.2	-3.5
4	-12.2	-13.6
5	-20.2	-20.6
6	-26.4	-28.0
7	-32.0	-34.0
8	-38.6	-40.2
9	-44.8	-47.0
10	-46.0	-52.4
20	-60.4	-60.0
30	-60.0	-60.0
50	-60.0	-60.0

NOTE :

1. No limit is required by the FCC for audio frequency response. The mrasured audio response data shows the role-off curve at 3 kHz.

5. TEST DATA

5.4 Modulation Characteristics – Modulation Limiting

FCC Rules :	Part 2 §2.1047(b) , §90.210
Operating Frequency :	143.025 MHz
Channel :	Middle
Referency Voltage :	7.2 VDC
Power Output :	5 Watts

12.5 KHz Channel Spacing

Audio Input	Positive Peak Deviation (dB)			Negative Peak Deviation (dB)

Note :

1. The spectrum bandwidth was set to RBW 100 kHz (freq. up to 1GHz) and RBW 1 MHz(freq above 1GHz).
2. Transmitter was set to the high power output(5 watts) condition.
3. The spectrum was checked from 30 MHz up to the 10th harmonic of the carrier frequency.
4. All emission not reported were found to be more than 20dB below the limit.
5. The EUT was positioned through 3 orthogonal axis and worst-case are reported.
6. ERP measurements were performed using the standard battery with full charged condition.
7. The limit was applied according to the section 90.210(d) 50 +10log(P) or -20dBm or 70dBc whichever is less.

5. TEST DATA

5.7 Spurious Emissions at Antenna Terminals

FCC Rules : Part 2 §2.1051 , §90.210(b)(d)
 Operating Frequency : 136.025/ 143.025/ 152.025 MHz
 Channel : Low / Mid / High
 Measured Output Power : 37.4 dBm (5.5Watts)
 Modulation Signal : FM modulation with 2.5kHz sine wave signal
 Channel Bandwidth : 12.5 kHz : Mask D

Frequency Tuned (MHz)	Ref.Level (dBm)	Emission Level (dBm)	Limit (dBm)	Margin (dB)	Remarks
136.025	40.0	36.5			Fundamental
272.10		-30.0	-20.0	-10	Pass

Frequency Tuned (MHz)	Ref.Level (dBm)	Emission Level (dBm)	Limit (dBm)	Margin (dB)	Remarks
143.025	40.0	36.9			Fundamental
286.05		-30.0	-20.0	-10	Pass

Frequency Tuned (MHz)	Ref.Level (dBm)	Emission Level (dBm)	Limit (dBm)	Margin (dB)	Remarks
152.025	40.0	36.3			Fundamental
299.95		-30.0	-20.0	-10	Pass

Note :

1. The spectrum was checked from 10 MHz up to the 10th harmonic(5GHz) of the carrier frequency.
2. All emission not reported were found to be more than 20dB below the limit.
3. The spectrum bandwidth was set to RBW 100 kHz (freq. up to 1GHz) and RBW 1 MHz(freq above 1GHz).
4. Transmitter was set to the high power output(4 watts) condition.
5. The limit was applied according to the section 90.210(d) $50 + 10\log(P)$ or -20dBm or 70dBc whichever is less.
6. Please refer to the plots for details.

5. TEST DATA

5.8 Frequency Stability

FCC Rules : Part 2 §2.1055 , §90.213
 Operating Frequency : 143.025 MHz
 Channel : Middle
 Reference Voltage : 7.2 VDC
 Power Output : 5 Watts
 Deviation Limit : 2.5ppm or 0.00025% for 12.5 kHz bandwidth

Voltage (%)	Power Supply (VDC)	Temperature (°C)	Frequency (Hz)	Deviation (%)
100 %	7.20	+20(Ref)	143,025,000	0.000000
100 %		- 30	143,024,912	0.000062
100 %		- 20	143,024,933	0.000047
100 %		- 10	143,024,966	0.000024
100 %		0	143,024,955	0.000032
100 %		+ 10	143,025,064	-0.000045
100 %		+ 20	143,025,048	-0.000034
100 %		+ 30	143,025,080	-0.000056
100 %		+40	143,025,131	-0.000092
100 %		+50	143,025,170	-0.000120
85 %	6.12	+ 20	143,024,983	0.000012
115 %	8.28	+ 20	143,024,986	0.000010
BATT. Endpoint	5.4	+ 20	143,024,989	0.000008

Note :

1. The AT -100A was tested with 5 watts RF output , 12.5kHz and 25 kHz channel bandwidth.
 The worst-case temperature deviation was recorded.

5. TEST DATA

5.8 Frequency Stability (continued)

5. TEST DATA

5.8 Frequency Stability (continued)

Operating Frequency : 143.025 MHz
 Channel : Middle
 Referency Voltage : 7.2 VDC
 Power Output : 5 Watts
 Deviation Limit : 5.0ppm or 0.0005% for 25 kHz bandwidth

Voltage (%)	Power Supply (VDC)	Temperature (°C)	Frequency (Hz)	Deviation (%)
100 %	7.20	+20(Ref)	143,025,000	0.000000
100 %		- 30	143,024,898	0.000072
100 %		- 20	143,024,920	0.000056
100 %		- 10	143,024,952	0.000034
100 %		0	143,024,983	0.000012
100 %		+ 10	143,025,068	-0.000048
100 %		+ 20	143,025,014	-0.000010
100 %		+ 30	143,025,131	-0.000092
100 %		+40	143,025,088	-0.000062
100 %		+50	143,025,017	-0.000012
85 %	6.12	+ 20	143,024,983	0.000012
115 %	8.28	+ 20	143,025,011	-0.000008
BATT. Endpoint	5.4	+ 20	143,024,989	0.000008

Note :

1. The AT -400B was tested with 5 watts RF output , 12.5kHz and 25 kHz channel bandwidth.
 The worst-case temperature deviation was recorded.

5. TEST DATA

5.8 Frequency Stability (continued)

5. TEST DATA

5.9 Transient Frequency Behavior

FCC Rules :	Part 90 §90.214
Operating Frequency :	143.025 MHz (WB:25KHz)
Channel :	Middle
Reference Voltage :	7.2 VDC
Power Output :	5 Watts
Ref. Signal Generator :	1kHz tone modulation with 25kHz dev.

FCC Limit @25KHz Channels

Time period	Time Intervals	Max. Frequency Difference(KHz)
t ₁	10 ms	± 25
t ₂	25 ms	± 12.5
t ₃	10 ms	± 25

Note : After t₂ and before t₃(switch off condition), the transient frequency difference shall not exceed the limit specified in §90.213 (5ppm @ operating frequency).

25KHz channel spacing Carrier Switch on time @ 143.025 MHz

Tek **Stop:** Single Seq 5.00kS/s

Note :

- The oscilloscope setting condition is as follows ;
 Time base : 10 ms/div.
 Trigger : On negative edge of Ch 2, level -14.8 mV
 Ch 1 : 490 mv/div. , Probe : 1:1
 Vertical Scale : ± 4 div. / correspond to ± 25 KHz

5. TEST DATA

5.9 Transient Frequency Behavior (continued)

FCC Rules :	Part 90 §90.214
Operating Frequency :	143.025 MHz (WB:25KHz)
Channel :	Middle
Reference Voltage :	7.2 VDC
Power Output :	5 Watts
Ref. Signal Generator :	1kHz tone modulation with 25kHz dev.

FCC Limit @25KHz Channels

Time period	Time Intervals	Max. Frequency Difference(KHz)
t ₁	10 ms	± 25
t ₂	25 ms	± 12.5
t ₃	10 ms	± 25

Note : After t₂ and before t₃(switch off condition), the transient frequency difference shall not exceed the limit specified in §90.213 (5ppm @ operating frequency).

25KHz channel spacing Carrier Switch off time @ 143.025 MHz

Tek **Stop** Single Seq 5.00kS/s

Note :

- The oscilloscope setting condition is as follows ;
 Time base : 10 ms/div.
 Trigger : On positive edge of Ch 2, level -40 mV
 Ch 1 : 46 mv/div. , Probe : 1:1
 Vertical Scale : ± 4 div. / correspond to ± 25 KHz

5. TEST DATA

5.9 Transient Frequency Behavior (continued)

FCC Rules :	Part 90 §90.214
Operating Frequency :	143.025 MHz (NB:12.5KHz)
Channel :	Middle
Reference Voltage :	7.2 VDC
Power Output :	5 Watts
Ref. Signal Generator :	1kHz tone modulation with 25kHz dev.

FCC Limit @12.5KHz Channels

Time period	Time Intervals	Max. Frequency Difference(KHz)
t ₁	10 ms	± 12.5
t ₂	25 ms	± 6.25
t ₃	10 ms	± 12.5

Note : After t₂ and before t₃(switch off condition), the transient frequency difference shall not exceed the limit specified in §90.213 (2.5ppm @ operating frequency).

12.5KHz channel spacing Carrier Switch on time @ 143.025 MHz

Tek **Stop**: Single Seq 5.00kS/s

Note :

- The oscilloscope setting condition is as follows ;
 Time base : 10 ms/div.
 Trigger : On negative edge of Ch 2, level -98 mV
 Ch 1 : 4.60 mv.
 Vertical Scale : ± 4 div. / correspond to ± 12.5 KHz

5. TEST DATA

5.9 Transient Frequency Behavior (continued)

FCC Rules :	Part 90 §90.214
Operating Frequency :	143.025 MHz (NB:12.5KHz)
Channel :	Middle
Reference Voltage :	7.2 VDC
Power Output :	5 Watts
Ref. Signal Generator :	1kHz tone modulation with 12.5kHz dev.

FCC Limit @12.5KHz Channels

Time period	Time Intervals	Max. Frequency Difference(KHz)
t ₁	10 ms	± 12.5
t ₂	25 ms	± 6.25
t ₃	10 ms	± 12.5

Note : After t₂ and before t₃(switch off condition), the transient frequency difference shall not exceed the limit specified in §90.213 (2.5ppm @ operating frequency).

12.5KHz channel spacing Carrier Switch off time @ 143.025 MHz

Tek **Stop**: Single Seq 5.00kS/s

Note :

- The oscilloscope setting condition is as follows ;
Time base : 10 ms/div.
Trigger : On positive edge of Ch 2, level -40 mV
Ch 1 : 46 mv
Vertical Scale : ± 4 div. / correspond to ± 12.5 KHz

6. SAMPLE CALCULATION

Emission Bandwidth

Type of Emission : F3E

Necessary Bandwidth and Emission Bandwidth :
12.5 kHz (Narrow Band Channel) : $B_n = 11K0F3E$
25 kHz (Wide Band Channel) : $B_n = 16K0F3E$

Calculation :

Max. modulation(M) in kHz : 3
Max. deviation(D) in kHz : 2.5(NB) and 5(WB)
Constant Factor(k) : 1
 $B_n = 2M + 2DK$

7. TEST EQUIPMENT LIST
