General remarks

The test results presented in this report relate only to the object tested. The results contained in this report reflect the results for this particular model and serial number. It is the responsibility of the manufacturer to ensure that all production models meet the intent of the requirements detailed within this report.

This report shall not be reproduced, except in full, without written approval of the issuing test laboratory.

1.7 Sample emission level calculation

The following is a description of terms and a sample calculation, as appears in the radiated emissions data table. The numbers used in the calculation are for example only. There is no direct correlation to specific data taken for the product described in this document:

Reading:

This is the reading obtained on the spectrum analyzer in dBμV. Any external preamplifiers used are taken into account through internal analyzer settings.

A.F.:

This is the antenna factor for the receiving antenna. It is a conversion factor, which converts electric field strength to voltage that can be measured directly on the spectrum analyzer. It is treated as a loss in dB. Cable losses have been included with the A.F. to simplify the calculations. The antenna factor is used in calculations as follows:

$$\text{Reading on analyzer (dB}\mu\text{V)} + \text{A.F. (dB)} = \text{Net field strength (dB}\mu\text{V/m)}$$

Measurement Uncertainty:

Test Measurement uncertainties (k=2.05):

Radiated Field strength at 3m measured with:

Bilog Antenna (30 MHz – 1 GHz)..... ±5.6 dB

Horn Antenna (1-18 GHz) ±4.0 dB

Net:

This is the net field strength measurement (as shown above).

Limit:

This is the FCC Class B radiated emission limit (in units of dBμV/m). The FCC limits are given in units of μV/m. The following formula is used to convert the units of μV/m to dBμV/m:

$$\text{Limit (dB}\mu\text{V/m)} = 20 * \log(\mu\text{V/m})$$

Margin:

This is the margin of compliance below the FCC limit. The units are given in dB. A positive margin indicates the emission was below the limit. A negative margin indicates that the emission exceeds the emission was below the limit.

Example only:

$$\begin{array}{rclclcl} \text{Reading} + \text{A.F.} & = & \text{Net Reading} & : & \text{FCC limit} - \text{Net reading} & = & \text{Margin} \\ 21.5 \text{ dB}\mu\text{V} + 26 \text{ db} & = & 47.5 \text{ dB}\mu\text{V/m} & : & 57.0 \text{ dB}\mu\text{V/m} - 47.5 \text{ dB}\mu\text{V/m} & = & 9.5 \text{ dB} \end{array}$$

Requirements			
An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator shall be considered sufficient to comply with the provisions of this section. The manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. When an antenna conducted measurement is used to determine the RF output power of the device, the effective gain of the antenna intended for the device must be stated based on measurement or on data from the measured RF output power before using the power limits.

	Declaration	
Requirements		
All transmission must use only digital modulation techniques.		
Results		
The test sample is an isochronous digital modulated device that operates in 1920-1930 MHz band. This device is based on DECT technology described in European Standards EN 300 175-2 and EN 300 175-3, now operating in frequency channels mentioned above.		
The operating modes are MC/TDMA/TDD (Multi carrier / Time Division Multiple Access / Time Division Duplex) using Digital GFSK modulation.		
For further details see operational description provided by manufacturer.

Radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a) (see Section 15.205(c)).			
When average radiated emission measurements are specified, including average emission measurements below 1000 MHz, there also is a limit on the peak level of the radio frequency emissions. The limit on peak radio frequency emissions is 20 dB above the maximum permitted average emission limit applicable to the equipment under test.			
*Measurement is performed with conducted measurement setup			
Comments: Final measurements verified manually with lowest margin measurements reported.

3.12 Test conditions and results – Receiver spurious emissions

Receiver spurious emissions acc. to IC RSS-213				Verdict: PASS	
Test performed by: ElectroMagnetic Investigations					
EUT requirement rule parts and clause		Reference			
		IC RSS-GEN 7.3 / 8.9			
Test according to measurement reference		Reference Method			
		ANSI C63.4			
Tested frequencies		Scan (All)			
Test frequency range		30 MHz – 5 th Harmonic			
EUT test mode		Receive			
Limits					
Frequency range [MHz]		Detector	Limit [μV/m]	Limit [dBμV/m]	Limit Distance [meters]
30 – 88		Quasi-Peak	100	40	3
88 – 216		Quasi-Peak	150	43.5	3
216 – 960		Quasi-Peak	200	46	3
960 – 1000		Quasi-Peak	500	54	3
>1000		Average	500	54	3
Comments:					
Final measurements verified manually with lowest margin measurements reported.					
*Physical distance between EUT and measurement antenna.					
**Emission level corresponds to ambient noise floor.

3.13 Test conditions and results – Automatic discontinuation of transmission

Automatic discontinuation of transmission acc. to FCC 15D / RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.319(f) / IC RSS-213 5.2	
Test according to measurement reference	Reference Method	
	Manual Evaluation	
EUT equipment type	Fixed Part	
Requirements		
The device shall automatically discontinue transmission in case of either absence of information to transmit or operational failure. This is not intended to preclude transmission of control and signaling information or use of repetitive codes used by certain digital technologies to complete frame or burst intervals.		

Result

3.14 Test conditions and results – Radiofrequency radiation exposure

Radiofrequency radiation exposure acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: N/A
Test performed by: ElectroMagnetic Investigations		
EUT requirement rule parts and clause	Reference	
	FCC 15.319(i) / IC RSS-102	
Requirements		
FCC: Unlicensed PCS devices are subject to the radiofrequency radiation exposure requirements specified in §§1.1307(b), 2.1091 and 2.1093. All equipment shall be considered to operate in a “general population/uncontrolled” environment. Applications for equipment authorization of devices operating under this section must contain a statement confirming compliance with these requirements for both fundamental emissions and unwanted emissions. Technical information showing the basis for thus statement must be submitted to the Commission upon request.		
IC: Category I and Category II equipment shall comply with the applicable requirements of RSS-102.		
Result		
Reference		Verdict
RF Exposure is addressed in a separate exhibit.		N/A

3.15 Test conditions and results – Monitoring threshold

Monitoring threshold acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: N/A
EUT requirement rule parts and clause	Reference	
	FCC 15.323(c)(2),(5),(9) / IC RSS-213 5.2 (2)(5)(9)	
Test according to referenced standards	Reference Method	
	ANSI C63.17 7.3.4	
Number of duplex channels used	5 carrier with 12 duplex timeslots = 60 duplex channels	
Requirements		
The monitoring threshold must not be more than 30 dB above the thermal noise power (KTB) of a bandwidth equivalent to the emission/occupied bandwidth of the device.		
Devices that have a power output lower than the maximum permitted under this standard may increase their detection threshold by 1 dB for each 1 dB that the transmitter power is below the maximum permitted.		
IC: If access to spectrum is not available as determined by the above, a minimum of 40 duplex system access channels are defined for the system, the time and spectrum windows with a power level below a monitoring threshold of 50 dB above the terminal noise power determined for the occupied bandwidth may be accessed.		
$T_u[\text{dBm}] = -174 + 10 * \log_{10}(\text{Bandwidth [Hz]}) M_U + P_{\text{MAX}}[\text{dBm}] - P_{\text{EUT}}[\text{dBm}]$ $T_L[\text{dBm}] = -174 + 10 * \log_{10}(\text{Bandwidth [Hz]}) M_L + P_{\text{MAX}}[\text{dBm}] - P_{\text{EUT}}[\text{dBm}]$		
With $M_U = 50$ dB and $M_L = 30$ dB, P_{MAX} as given under “Peak transmit power” and bandwidth as emission or occupied bandwidth. The power threshold limit is given by $T_U + U_M$ ($U_M = 6$ dB).

3.16 Test conditions and results – LIC confirmation

LIC confirmation acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.323(c)(5) / IC RSS-213 5.2(5)	
Test according to referenced standards	Reference Method	
	ANSI C63.17 7.3.2	
Requirements		
A device utilizing the provisions of FCC 47 CFR 15.323(c)(5) / IC RSS-213(b)(5) must have monitored all access channels defined for its system within the last 10 seconds and must verify, within the 20 milliseconds (40 milliseconds for devices designed to use a 20 millisecond frame period) immediately preceding actual channel access, that the detected power of the selection time and spectrum windows is no higher than the previously detected value.		
Test Result		
Evaluation		Verdict
The requirement is verified using the “Monitoring time” and “LIC Selection” test.		PASS
Comments: The EUT performs a continuous scan of all 5 allocated US carriers. With a frame repetition rate of 10 ms, the system refreshes its Least Interfered Channel (LIC) list for all defined access channels well within the 10-second cumulative monitoring limit.

3.21 Test conditions and results – Monitoring reaction time

Monitoring reaction time acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: Pass
EUT requirement rule parts and clause	Reference	
	FCC 15.323(c)(7) / IC RSS-213 5.2(7)	
Test according to referenced standards	Reference Method	
	ANSI C63.17 7.5	
Requirements		
The monitor shall have a maximum reaction time less than 50xSQRT (1.25/emission(occupied) bandwidth in MHz) microseconds for signal at the applicable threshold level but shall not be required to be less than 50 microseconds. If a signal is detected that is 6 dB or more above the applicable threshold level the maximum reaction time shall be 35xSQRT (1.25/emission(occupied) bandwidth in MHz) microseconds but shall not be required to be less than 35 microseconds.		

Test results

The provisions of FCC 47 CFR 15.323(c)(10), IC RSS-213(b)(10) or FCC 47 CFR 15.323(c)(12), IC RSS – 213(b)(12) shall not be used to extend the range of spectrum occupied over space or time for the purpose of denying fair access to spectrum to other devices.		
Declaration		
The manufacturer declares that the device does not work in a mode which denies fair access to spectrum for other participants.		

3.27 Test conditions and results – Frame period and jitter

Frame period and jitter acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: PASS
EUT requirement rule parts and clause	Reference	
	FCC 15.323(e) / IC RSS-213 5.2(13)	
Test according to referenced standards	Reference Method	
	ANSI C63.17 6.2.3	
Requirements		
The frame period (a set of consecutive time slots in which the position of each time slot can be identified by reference to a synchronizing source) of an intentional radiator operating in the sub-band shall be 20 milliseconds/X where X is a positive whole number.		
The jitter (time-related, abrupt, spurious variations in the duration of the duration of the frame interval) introduced at the two ends of a communication link shall not exceed 25 microseconds for any two consecutive transmissions.		
Test results – Frame period

3.28 Test conditions and results – Frame and repetition stability

Frame and TDMA repetition stability acc. to FCC 47 CFR 15D / IC RSS-213		Verdict: PASS	
EUT requirement rule parts and clause	Reference		
	FCC 15.323(e) / IC RSS-213 5.2(13)		
Test according to referenced standards	Reference Method		
	ANSI C63.17 6.2.2		
Access scheme used	Time Division Multiple Access		
Requirements			
Each device that implements time division for the purpose of maintaining a duplex connection on a given frequency carrier shall maintain a frame repetition rate with a frequency stability of at least 50 parts per million (ppm). Each device which further divides access in time in order to support multiple communication links on a given frequency carrier shall maintain a frame repetition rate with a frequency stability of at least 10 ppm.			
Test results			
Access scheme	Error [ppm]	Limit [ppm]	Verdict
Antenna 0			
Time Division multiple Access	0.8	10	PASS
Antenna 1			
Time Division multiple Access	0.6	10	PASS
