CERTIFICATION

Rubicom Systems, Inc. certifies the information obtained in this report was performed consistent with the requirements of ANSI C63.4-1992. The Intersil Corp. PRISM II Wireless Transmitter complies with the requirements of CFR 47 Part 15 for Intentional Radiators as required in Paragraph 15.247(a)(2)(b)(1)(c) and (d).

This data was obtained while testing a PRISM II, serial number 9936-0027, furnished by Intersil Corp. Any modifications to the unit as tested may invalidate the data and void this certification.

ABSTRACT

This report presents test results of the emanations found emitting from the Intersil Corp. 2.4GHz PRISM II Wireless Transmitter and the comparison of these emissions to the requirements of FCC, Title 47, Part 15, Subpart C for Intentional Radiators as required for direct sequence type spread spectrum systems operating in the 2.4 to 2.4835GHz range.

This testing was performed on a 3 meter open field test site at Rubicom Systems, Inc. (RSI). The testing was performed for Intersil under purchase order 0400244252. The results of this test effort demonstrate compliance of the Intersil Corp. 2.4GHz PRISM II Wireless Transmitter to FCC, Title 47, Part 15, Subpart C Intentional Radiators (Paragraph 247(2)). The unit under test was serial number 9936-0027 for the radiated and conducted measurements.

1.0 INTRODUCTION

1.1 Purpose

The purpose of this report is to show compliance of the Intersil PRISM II Wireless Transmitter to the requirements of Part 15 of the FCC Rules and Regulations (47CFR, Part 15, Subpart C) for Intentional radiators. The applicable paragraphs covered by this report are 15.247(2) (b), (c).

1.2 Requirements

The test requirements for an Intentional Radiator are as follows:

RADIATED (15.205)

<u>Frequency (MHZ)</u>	<u>Field Strength (μV/m)</u>	<u>Measurement Distance (m)</u>
0.009-0.490	2400/F (KHz)	300
0.490-1.705	240000/F (KHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500 Average	3

CONDUCTED (15.207)

<u>Freq. (MHz)</u>	<u>μVolts</u>	<u>dBμV</u>
.450-30MHz	250	48

DIRECT SEQUENCE SPREAD SPECTRUM SYSTEM

15.247(2) Bandwidth

The minimum 6dB bandwidth shall be greater than 500KHz.

15.247(2)(b) Maximum Peak Power

The maximum peak output power of the transmitter shall not exceed 1 watt.

15.247(2)(c) Out of Band Emissions, Radiated & Conducted

Power produced by Modulation Products of the Spreading Sequence, Information Sequence and the Carrier Frequency.

Levels in any 100KHz outside the frequency band shall be 20dB below that of any 100KHz band within the band that contains the highest level of the desired power or the requirements of 15.209, whichever results in lesser attenuation. All other emissions shall not exceed the limits of Section 15.209(a). Section 15.205 requirements are applicable.

15.247(d) Power Density

Transmitted power density averaged over any one (1) second interval shall not be greater than 8dBm in any 3KHz bandwidth.

1.3 Unit Under Test Description

PRISM was the first comprehensive chip set solution for 2.4GHz Direct Sequence Spread Spectrum (DSSS) applications which takes the complexity out of the design of wireless systems: wireless local area network links, handheld transceivers and point-to-point microwave communications systems.

PRISM II is the latest generation chip set which packs a high-level system architecture into 5 interoperable IC's with data rates of 1,2, 5.5 and 11MBPS applications based on the IEEE802.11 global standard for WLAN applications.

1.4 Summary of Results

Paragraph 6.0 of this document presents the detailed results of each required test for the PRISM II. Each paragraph lists the signals determined to be emanating from the PRISM II.

No modifications were required of the unit under test for this test effort.

The data shows compliance to the requirements stated in paragraph 1.2 of this document.

2.0 APPLICABLE DOCUMENTS

The following documents form a part of this report to the extent expressed herein:

FCC Code of Federal Regulations Title 47, Part 15

FCC Procedure for Measuring RF Emissions from Computing Devices
FCC/OET MP-4, July 1987

ANSI C63.4-1992

FCC Characteristics of Open Field Test Sites Bulletin OET 55, October
1989

3.0 TEST SITE DESCRIPTION

This testing was performed at Rubicom Systems, Inc. 3 meter test site. The description of the measurement facility was found to be compliant with the requirements of Section 2.948 of the FCC Rules. A copy of the compliance letter is attached to this report as Appendix A.

3.1 Environmental Conditions

This test effort was performed from 21 September, 1999 through 6 October, 1999. Typical conditions for the test site during this testing was:

Temperature:	75° - 82° F
Barometer:	29.40 - 29.70 inches
Humidity:	70 - 80%

4.0 TEST INSTRUMENTATION

The following test equipment was used to perform this testing.

<u>Qty.</u>	<u>Description</u>	<u>Manufacturer</u>	<u>Model No.</u>	<u>Cal.Due</u>	<u>Cal Cycle</u>
1	Spectrum Analyzer	Advantest	R3271A	04/07/00	1 yr.
2	Bi-Log antenna	Chase	CLB6111B	07/10/00	1 yr.
1	Plotter	Hewlett Packard	7440A	NCR	
1	Ridge Guide Horn Antenna	Electro Metrics	RGA-180 1-18GHz	01/15/00	1 yr.
1	Power Meter (Peak)	Wavetek	1018B	06/16/00	1 yr.
1	Pre-Amplifier	Hewlett Packard	8449B	05/25/01	2 yr.
1	Bandreject Filter	Lorch Microwave	6BR6-2440	03/04/01	2 yr.

5.0 TEST SAMPLE SETUP AND CONFIGURATIONS

The PRISM II was placed on a nonconductive table inside a shielded enclosure. The PRISM II was installed into a Compaq Armada 1700 Laptop computer. During conducted measurements the output was coupled directly to the spectrum analyzer.

During radiated emissions the PRISM II was placed on the turn table. The transmitter was put into operation with a 1MBPS modulation during the radiated measurements.

Photo 1 presents the unit placed on the turntable during radiated testing.

PHOTO 1

6.0 PROCEDURES AND RESULTS

6.1 General

The data presented in this report is provided using the Advantest Spectrum Analyzers. The analyzer allows the antenna factors/cable loss, etc., to be listed in tables on a memory card. Test setups for recall are programmed. This method allows the tester to plot data instantaneously against the specification requirement. The specification limits are presented with the extrapolation for distance (20dB/decade) where necessary. When external attenuation is required for analyzer protection, the reference level offset is used.

Signal identification is partially accomplished by turning the system power "on" and "off" while observing the spectrum. All signals found to be emitting from the EUT are maximized in azimuth and elevation. Should the need arise to have more than a single plot of the frequency range the maximized signal would be linked to the proper plot.

The displayed levels are calculated in the analyzer as follows: MTR Reading + Antenna Factor + Cable Loss - Gain (where appropriate) = Signal level.

NOTE: The correction factors and conversion factors are combined in the memory card.

6.2 Power Line Conducted 15.207

The unit was installed into a Compaq Armada 1700 Laptop computer. Power line conducted was then run on the laptop. Both the phase and neutral leads were tested using a Solar Model 8012-50-24-BNC PLISN ($50\mu\text{H}/50\text{ohm}$). Data Sheets 6.2-1 and 6.2-2 present the 450KHz-30MHz Quasi Peak sweeps. Photo 2 presents the conducted emissions described.

6.3 Radiated Emissions 15.209/15.205

6.3.1 Radiated Emissions (Pre-Scans)

Radiated emission pre-testing was performed on the system inside the shielded enclosure. Pre-scans were performed over the frequency range of 30MHz-1GHz. These scans are for frequency content in the high ambient range. This test is performed at 1 meter. No significant signals were detected during this evaluation. Data Sheets 6.3.1-1 through 6.3.1-12 present the results of this testing.
