FORWARD:

In accordance with the Federal Communications Code of Federal Regulations, dated October 1, 1997, Part 2 Subpart J, Paragraphs 2.905, 2.911, 2.913, 2.925, 2.926, 2.1031 through 2.1057, Part 90, Subpart M, Paragraphs 90.201 through 90.217, and 90.350 through 90.363; the following is submitted:

2.1033(c) Application for Certification

1. Manufacturer: SOUTHERN TECHNOLOGIES CORPORATION
6145 Preservation Drive
P.O. Box 23807
Chattanooga, TN 37422
2. Identification: Model: SMARTSCAN
PORTABLE AEI READER

FCC I.D.: OTR2200-540
3. Refer to exhibit for a copy of the operating instructions.
4. Emission Type: 320KNON
5. Frequency Range: 916.5 MHz
6. Operating Power Level: 0.9 Watt
7. Max Power rating: 1 Watt.
8. Power into final amp:

4.96 Vdc @ 0.296 amps (1.4 Watts)
9. Refer to exhibit for tune-up procedure.
10. Refer to exhibit for Circuit Diagrams.
11. Refer to exhibit for identification label information.
12. Refer to exhibit for photographs.

ROGERS LABS, INC.

SOUTHERN TECHNOLOGIES CORPORATION

MODEL: SMARTSCAN PORTABLE AEI READER

Test #: 991109

Test to: FCC Parts 2 and 90

FCC ID#: OTR2200-540

Page 3 of 20

2.1046 RF Power Output

Measurements Required:

Measurements shall be made to establish the radio frequency power delivered by the transmitter into the standard output termination. The power output shall be monitored and recorded and no adjustment shall be made to the transmitter after the test has begun, except as noted below:

If the power output is adjustable, measurements shall be made for the highest and lowest power levels.

Test Arrangement:

The radio frequency power output was measured with a spectrum analyzer and antenna. Since the unit has no removable antenna, access to an antenna port is not available. A HP 8562A Spectrum Analyzer was used to measure the radio frequency power. The data was taken in dBμV/m and converted to watts as shown in the following Table. Data taken per Paragraph 2.1046 and applicable parts of Part 90.

$$E(V/m) = 10^{(dB\mu V/M - 120/20)}$$

$$E = 10^{(127.0 - 120 / 20)}$$

$$\text{Then } E = 2.24$$

$$P(W) = \frac{(Ed)^2}{49.2}$$

$$P(W) = 0.917 \text{ Watts}$$

Results:

FREQUENCY	P _{dBμV/m @ 3m}	P _{Watts}
916.5	127.0	0.917

The specifications of Paragraph 2.1046 and 90.205 are met. There are no deviations to the specifications.

2.1047 Modulation Characteristics

Measurements Required:

A curve or equivalent data that shows that the equipment will meet the modulation requirements of the rules under which the equipment is to be licensed shall be submitted.

Test Arrangement:

The radio frequency output was monitored with a HP 8562A Spectrum Analyzer. The spectrum analyzer was used to observe the radio frequency spectrum with the transmitter operating in a normal mode.

Results:

Refer to Appendix for details about modulation. Specifications of Paragraphs 2.1047 and 90.211 are met. There are no deviations to the specifications.

2.1049 Occupied Bandwidth

Measurements Required:

The occupied bandwidth, that is the frequency bandwidth such that below its lower and above its upper frequency limits, the mean powers radiated are equal to 0.5 percent of the total mean power radiated by a given emission. Refer to Figure 1 showing the 99.5% power measurement.

Test Arrangement:

Results:

MARKER Δ
313 kHz
.33 dB

ACTV DET: PEAK
MEAS DET: PEAK QP AVG
MKR 313 kHz
.33 dB

Figure 1 99.5% Power Occupied Bandwidth

f_c	O.B. MHz
916.5	0.313

Requirements of 2.1049 and applicable parts of Paragraph 90 are met . There are no deviations to the specifications.

2.1051 Spurious Emissions at Antenna Terminals

Measurements Required:

The radio frequency voltage or power generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna.

Test Arrangement:

The integral antenna can not be removed or replaced with a spectrum analyzer with 50 Ω impedance.

The radio frequency output was measured using a HP 8562A Spectrum Analyzer and appropriate antennas and attenuation. The spectrum analyzer was used to observe the radio frequency spectrum with the transmitter operating in a normal mode. The frequency spectrum from 0 to 10 GHz was observed. Spurious emissions testing was done at the 3 meters OATS. Data taken per 2.1051 and applicable parts of Part 90.

The emission mask for transmitters that are not equipped with audio low-pass filters, emissions on any frequency removed from the center of the authorized bandwidth by more than 250% of the authorized bandwidth shall be attenuated by at least $55 + 10 \log(P_o)$ dB. The limit for the SMARTSCAN Portable AEI Reader:

$$\text{Limit} = 55 + 10 \log(1)$$

$$\text{Limit} = 55 + 10(0)$$

$$\text{Limit} = 55 \text{ dB}$$

FREQUENCY	SPURIOUS FREQ. (GHz)	LEVEL BELOW CARRIER (dB)
916.5	1833.4	63.8
	2749.5	63.4
	3666.0	58.4

Data taken per 2.1051 and applicable parts of Part 90. Specifications of Paragraphs 2.1051 and 90.210(K)(3) are met. There are no deviations to the specifications.

2.1053 Field Strength of Spurious Radiation

Measurements Required:

Measurements shall be made to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation. The integral antenna was installed on the reader for all spurious radiation measurements.

Test Arrangement:

The transmitter was placed on a wooden turntable 0.8 meters above the ground plane and at a distance of 3 meters from the FSM antenna. The transmitter was activated and the frequency spectrum of the fundamental was observed. The turntable was rotated through 360 degrees to locate the position registering the highest amplitude emission. The amplitude of the fundamental frequency was measured and recorded. The frequency spectrum was then searched for spurious emissions generated from the transmitter. The amplitude of each spurious emission was maximized by raising and lowering the FSM antenna and rotating the turntable before data was recorded. A log periodic antenna was used for frequencies of 200 MHz to 5 GHz and pyramidal horn antennas were used for frequencies of 5 GHz to 40 GHz. Emission levels were measured and recorded from the spectrum analyzer in dBμV. This level was then added to the antenna factor less the amplifier gain to calculate the field strength at 3 meters. Data was taken at the ROGERS LABS, INC. 3 meters open area test site (OATS). A description of the test facility is on file with the FCC, Reference: 31040/SIT, 1300F2, dated February 6, 1998. The testing procedures used conforms to the procedures stated in the ANSI 63.4-1992 document.

Calculations made are as follows:

CFS = Calculated Field Strength
FSM = Field Strength Measurement

$$\begin{aligned} \text{CFS} &= \text{FSM} + \text{Antenna Factor} - \text{Amplifier Gain} \\ \text{CFS} &= 101.1 + 25.9 \\ \text{CFS} &= 127.0 \end{aligned}$$

The limit for emissions are defined by the following equations:

Limit = Amplitude of spurious emission must be attenuated by this amount below the level of the fundamental.

$$\begin{aligned} \text{Attenuation} &= 55 + 10 \log_{10}(P_w) \\ &= 55 + 10 \log_{10}(1.0) \\ &= 55 \text{ dB} \\ \text{Limit} &= 127.0 - 55 \\ &= 72.0 \end{aligned}$$

Results:

General Radiated Emissions (6 Highest Emissions)

Frequency in MHz	FSM Horz. (dBμV)	FSM Vert. (dBμV)	Antenna Factor (dB/m)	Amp. Gain (dB)	CFS Horz. @ 3m (dBμV/m)	CFS Vert. @ 3m (dBμV/m)	FCC CLASS b Limit @ 3m (dBμV/m)

Page 9 of 20

2.1055 Frequency Stability

Measurements Required:

The frequency stability shall be measured with variations of ambient temperature from -30° to $+50^{\circ}$ centigrade. Measurements shall be made at the extremes of the temperature range and at intervals of not more than 10° centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement. In addition to temperature stability the frequency stability shall be measured with variation of primary supply voltage as follows:

- (1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.
- (2) For hand carried, batteries powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.
- (3) The supply voltage shall be measured at the input to the cable normally provided with the equipment, or at the power supply terminals if cables are not normally provided.

Test Arrangement:

The measurement procedure outlined below shall be followed:

Step 1: The transmitter shall be installed in an environmental test chamber whose temperature is controllable. Provision shall be made to measure the frequency of the transmitter.

Step 2: With the transmitter inoperative (power switched "OFF"), the temperature of the test chamber

shall be adjusted to +25°C. After a temperature stabilization period of one hour at +25°C, the transmitter shall be switched "ON" with standard test voltage applied.

Step 3: The carrier shall be keyed "ON", and the transmitter shall be operated unmodulated at full r.f. power output at the duty cycle for which it is rated, for a duration of at least 5 minutes. The r.f. carrier frequency shall be monitored and measurements shall be recorded.

Step 4: The test procedures outlined in Steps 2 and 3, shall be repeated after stabilizing the transmitter at the environmental temperatures specified, -30°C to 50°C in 10 degree increments.

The frequency stability was measured with variations in the power supply voltage from 85 to 115 percent of the nominal value. A Sorensen DC Power Supply was used to vary the dc voltage for the power input from 9.0 Vdc to 12.2 Vdc. The unit incorporates a battery sense circuit to power down when the battery voltage is reduced below 8.4 volts. The frequency was measured and the variation in parts per million was calculated. Data was taken per Paragraphs 2.1055 and 90.213.

Results:

Temperature Stability $f_0 = 916.500 \text{ MHz}$

FREQ. (MHz)	FREQUENCY STABILITY VS TEMPERATURE IN PARTS PER MILLION (PPM)								
	Temperature in °C								
	-30	-20	-10	0	+10	+20	+30	+40	+50
916.5000	-28.5	-23.1	-18.5	-13.1	1.0	7.6	-6.7	-14.1	-32.7

FREQUENCY IN MHz	STABILITY VS VOLTAGE VARIATION 15% IN PPM INPUT VOLTAGE			
	9.0 V _{dc}	10.6 V _{dc}	12.2 V _{dc}	8.5 V _{dc}
916.5000	0	0	0	0

Specifications of Paragraphs 2.995 and 90.213 are met.
There are no deviations to the specifications.

CERTIFICATION\STCAEI 12/03/1999

QUALIFICATIONS

of

SCOT D. ROGERS, ENGINEER**ROGERS LABS, INC.**

Mr. Rogers has approximately 12 years experience in the field of electronics. Six years working in the automated controls industry and 6 years working with the design, development and testing of radio communications and electronic equipment.

POSITIONS HELD:

Systems Engineer:	A/C Controls Mfg. Co., Inc. 6 Years
Electrical Engineer:	Rogers Consulting Labs, Inc. 5 Years
Electrical Engineer:	Rogers Labs, Inc. Current

EDUCATIONAL BACKGROUND:

- 1) Bachelor of Science Degree in Electrical Engineering from Kansas State University.
- 2) Bachelor of Science Degree in Business Administration Kansas State University.
- 3) Several Specialized Training courses and seminars pertaining to Microprocessors and Software programming.

Attention: Scot D. Rogers

Re: Measurement facility located at above address
(3 and 10 meter site)

Gentlemen:

Your submission of the description of the subject measurement facility has been reviewed and found to be in compliance with the requirements of Section 2.948 of the FCC Rules. The description has, therefore, been placed on file and the name of your organization added to the Commission's list of facilities whose measurement data will be accepted in conjunction with applications for certification or notification under Parts 15 or 18 of the Commission's Rules. Our list will also indicate that the facility complies with the radiated and AC line conducted test site criteria in ANSI C63.4-1992. Please note that this filing must be updated for any changes made to the facility, and at least every three years the data on file must be certified as current.

Per your request, the above mentioned facility has been also added to our list of those who perform these measurement services for the public on a fee basis. This list is updated monthly and is available on the Laboratory's Public Access Link (PAL) at 301-725-1072, and also on the Internet at the FCC Website www.fcc.gov/oet/info/database/testsite/.

Sincerely,

Thomas W. Phillips
