6. EUT TEST SETUPS

For each test the EUT was exercised to find out the worst case of operation mode and device configuration.

The EUT was equipped with an external antenna connector for conductive measurements.

6.1 EUT test set-up

This setup was used in conducted measurements. The Bluetooth simulator was used to control the following:

- set the EUT channel (0 - 78)
- set the number of EUT TX slots (1, 3, 5)
- set the EUT to TX, RX and TX/RX mode
- enable/disable frequency hopping
- select between several different test modulation patterns

In tests, where absolute level reporting were required, the results were corrected with all applicable factors as detailed in the result section of each measurement.

For a photo of the test set-up that was used for Bluetooth Conducted Measurements, please refer to Section 1 of Appendix A.
