I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to, or exclusions from the FCC Part 2, FCC Part 22, Industry Canada RSS-131, and ANSI C63.4.

1 GENERAL INFORMATION

This Type Certification Report is prepared on behalf of **Mobile Communication Technologies, Inc. (MCT, Inc)**, in accordance with the Federal Communications Commission and Industry Canada Rules and Regulations. The Equipment Under Test (EUT) is **Model BST850, FCC ID: OW5BST850**. The test results reported in this document relate only to the item that was tested.

All measurements contained in this application were conducted in accordance with FCC Rules and Regulations CFR 47, Industry Canada RSS-131, and ANSI C63.4 Methods of Measurement of Radio Noise Emissions, 1992. The instrumentation utilized for the measurements conforms to the ANSI C63.4 standard for EMI and Field Strength Instrumentation. Calibration checks are performed regularly on the instruments, and all accessories including high pass filter, coaxial attenuator, preamplifier and cables.

1.1 TEST FACILITY

The open area test site and conducted measurement facility used to collect the radiated data is located on the parking lot of Rhein Tech Laboratories, Inc. 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170. This site has been fully described in a report dated March 3, 1994, submitted to and approved by the Federal Communications Commission to perform AC line conducted and radiated emissions testing (ANSI C63.4 1992).

1.2 RELATED SUBMITTAL(S)/GRANT(S)

This is an original application report.

2 TESTED SYSTEM DETAILS

2.1 JUSTIFICATION

The EUT was tested in all three orthogonal planes in order to determine worst case emission. The EUT was investigated and tested from 9 kHz to 9 GHz.

Listed below are the identifiers and descriptions of all equipment, cables, and internal devices used with the EUT for this test, as applicable.

2.2 SYSTEM COMPONENTS

PART	MANUFACTURER	MODEL	SERIAL NUMBER	FCC ID	CABLE DESCRIPTION	RTL BAR CODE
Amplifier	MCT, Inc.	BST850	#2	OW5BST850	Unshielded Power	15162
Magnetic Mount Antenna	MCT, Inc.	SEM15MX	N/A	N/A	3 m RG 174 or 4.2 m RG 58 Shielded I/O	15104
Glass Mount Antenna	MCT, Inc.	SEM2X	N/A	N/A	3 m RG 174 or 4.2 m RG 58 Shielded I/O	15105

2.3 CONFIGURATION OF TESTED SYSTEM

FIGURE 1: CONFIGURATION OF SYSTEM UNDER TEST

3 FCC PART 2.1033(C)(8); DC VOLTAGES AND CURRENTS

The DC voltages applied to, and DC currents into, the several elements of the final radio frequency amplifying device for normal operation over the power range.

13.8 volt; 1 Amp

The DC voltage and total input current of the entire final power amplifier module is 13.8 VDC and 1A.

5 FCC RULES AND REGULATIONS PART 2.1046 (A); CONDUCTED RF INPUT VS OUTPUT POWER

5.1 TEST PROCEDURE

ANSI/TIA/EIA-603-1992

The EUT was set up at the middle channel frequency 850 MHz to receive input power from a signal generator while the output was connected to a power meter. The input power (CW) from the signal generator was increased while observing the output power. The maximum power necessary to cause the EUT to saturate was recorded and plotted in the table and plot below.

6 NON-LINEARITY RSS-131 §5.3

6.1 TEST PROCEDURE

Two-tone test: Two signal generators were connected to the input of the device under test (DUT), via a proper impedance matching network so that the two input signals were equal. A dummy load of suitable load rating to the enhancer output point was connected. A spectrum analyzer was connected to this output point via a coupling network and attenuator. The two generator frequencies f_1 and f_2 were set such that they and their third order intermodulation product frequencies, $f_3 = 2f_1 - f_2$ and $f_4 = 2f_2 - f_1$, are all within the passband of the DUT. The input level to the DUT was raised while observing the output tone levels, P_{01} and P_{02} , and the intermodulation product levels, P_{03} and P_{04} . In a two-tone test, the mean output power is given by $P_{01} + 3$ dB and the peak envelope power by $P_{01} + 6$ dB.

The input level to the DUT was raised until the greater level of the I.M. products at the enhancer output terminals, P_{03} or P_{04} , equaled -43 dBW. All signal levels and their frequencies were recorded. The mean output power was calculated under this testing condition, given by: $P_{\text{mean}} = P_{01} + 3$ dB.

Minimum standard: Transmitter signals amplified by a non-linear device (enhancer or translator) will alter the occupied bandwidth of the transmitted signals; therefore, the extent of non-linearity shall be tested. Any intermodulation product level must be attenuated, relative to P , by at least:

43 + 10 Log P or 70 dB, whichever is less stringent, where P is the total RF output power of the test tones in watts.

6.2 TEST DATA

PLOT 6-1: INTERMODULATION PRODUCTS

TABLE 6-1: INTERMODULATION PRODUCTS

Frequency (MHz)	Signal Generator Level (Input) (dBm)	Amplitude (dBm)	Limit 43+10LogP (-13 dBm)	Margin	Comments
829.02	11.5	-13.77	-13.0	-0.77	P ₀₃

7 FCC RULES AND REGULATIONS PART 2.1046 (A); RF POWER OUTPUT: RADIATED ERP PER PART 22.913

7.1 TEST PROCEDURE

ANSI/TIA/EIA-603-1992, section 2.2.1.

Substitution Method:

The EUT was set up at an antenna-to-EUT distance of 3 meters on an open area test site. The EUT was placed on a nonconductive turntable 1.0 meter above the ground plane. The physical arrangement of the EUT was varied through three orthogonal planes in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. At each frequency, the EUT was rotated 360 degrees, and the antenna was raised and lowered from one to four meters in order to determine the maximum emission levels. Measurements were taken using both horizontal and vertical antenna polarizations.

The worst-case, maximum radiated emission was recorded and used as reference for the measurement. The EUT was then replaced with a $\frac{1}{2}$ wave dipole antenna and polarized in accordance with the EUT's antenna polarization. The $\frac{1}{2}$ wave dipole antenna was connected to a RF signal generator with a coaxial cable. The search antenna height, and search antenna polarity was set to levels that produced the previously recorded maximum reading. The signal generator was adjusted to a level that produced this emission level. The signal generator level was recorded and corrected by the power loss in the cable between the generator and the antenna and further corrected for the gain of the substitution antenna used relative to an ideal $\frac{1}{2}$ wave dipole antenna. The signal generator corrected level is the ERP level.

PLOT 9-11: CELLULAR TDMA CONDUCTED SPURIOUS UPPER CHANNEL

PLOT 9-12: CELLULAR TDMA CONDUCTED SPURIOUS UPPER CHANNEL

Frequency range of measurement per Part 2.1057: 9kHz to 10 x Fc

Limits: Mask B (dBm): $P(\text{dBm}) - (43 + 10 \times \log P(\text{W}))$

The following channels (in MHz) were investigated: 824.2, 836.6, and 848.8 MHz. The worse case (unwanted emissions) channels are shown. The magnitude of emissions attenuated more than 20 dB below the FCC limit need not be recorded.

TABLE 9-1: CONDUCTED SPURIOUS EMISSIONS LOWER FREQUENCY – 824.2 MHZ

(824.2MHz); Conducted power = 3 W

Frequency (MHz)	Level (dBc)	Limit (dBc)	Margin (dB)
1648.40	55.1	47.8	-7.3
2472.60	75.8	47.8	-28.1
3296.80	73.6	47.8	-25.9
4121.00	74.9	47.8	-27.2
7773.00	70.9	47.8	-23.1

TABLE 9-2: CONDUCTED SPURIOUS EMISSIONS MIDDLE FREQUENCY – 836.6 MHZ

(836.6 MHz); Conducted power = 3 W

Frequency (MHz)	Level (dBc)	Limit (dBc)	Margin (dB)
1673.20	60.7	47.8	-12.9
2509.80	76.9	47.8	-29.1
3346.40	73.7	47.8	-25.9
4183.00	75.3	47.8	-27.6
7644.00	71.0	47.8	-23.2

TABLE 9-3: CONDUCTED SPURIOUS EMISSIONS UPPER FREQUENCY – 848.8 MHZ

(849.8MHz); Conducted power = 3 W

Frequency (MHz)	Level (dBc)	Limit (dBc)	Margin (dB)
1697.60	60.3	47.8	-12.5
2546.40	74.1	47.8	-26.4
3395.20	72.4	47.8	-24.6
4244.00	75.2	47.8	-27.4
7804.00	71.6	47.8	-23.8

10 FCC RULES AND REGULATIONS PART 2.1053 (A): FIELD STRENGTH OF SPURIOUS RADIATION

10.1 TEST PROCEDURE

ANSI/TIA/EIA-603-1992, section 2.2.12

Substitution Method:

The EUT was set up at an antenna-to-EUT distance of 3 meters on an open area test site. The EUT was placed on a nonconductive turntable 1.0 meter above the ground plane.

The physical arrangement of the EUT was varied through three orthogonal planes in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. At each frequency, the EUT was rotated 360 degrees, and the antenna was raised and lowered from one to four meters in order to determine the maximum emission levels. Measurements were taken using both horizontal and vertical antenna polarizations.

The worst-case maximum radiated emission was recorded and used as a reference for the measurement.

The EUT was then replaced by a $\frac{1}{2}$ wave dipole antenna and polarized in accordance with the EUT's antenna polarization. The $\frac{1}{2}$ wave dipole antenna was connected to an RF signal generator with a coaxial cable.

The search antenna height and search antenna polarity was set to levels that produced the maximum reading. The signal generator was adjusted to a level that produced the radiated emission level.

The signal generator level was recorded and corrected by the power loss in the cable between the generator and the antenna, and further corrected for the gain of the substitution antenna used relative to an ideal $\frac{1}{2}$ wave dipole antenna. The signal generator corrected level is the spurious radiation emission level.

The transmitter is terminated with a $50\ \Omega$ load and interfaced with a spectrum analyzer.

10.2 TEST DATA

Frequency range of measurement per Part 2.1057: 9kHz to $10 \times F_c$

Limits: Mask B (dBm): $P(\text{dBm}) - (43 + 10 \times \text{LOG } P(\text{W}))$

The magnitude of emissions attenuated more than 20 dB below the FCC limit need not be recorded.

TABLE 10-1: RADIATED SPURIOUS EMISSIONS MIDDLE FREQUENCY – 836.6 MHZ

Frequency (MHz)	Signal Generator (dBm)	Cable Loss (dB)	Antenna Gain (dBd)	Corrected Signal Generator (dBc)	Limit (dBc)	Margin (dB)
1673.20	-29.3	0.5	4.7	59.9	47.8	-12.1
2509.80	-30.7	0.6	5.2	60.9	47.8	-13.1

11 TEST PROCEDURE FCC RULES AND REGULATIONS PART 22.901(D): BAND EDGE COMPLIANCE

Compliance with the band edges was performed using the FCC's "Radiated Measurement at a Band Edge" guidance document.

11.1 TEST DATA

The following plots were made using radiated measurements. The center frequency of the spectrum analyzer display was set to frequency channels of block edges A and B for GSM modulation since it produced the worst case bandwidth.

PLOT 11-1 LOWER BAND EDGE A1 824 MHZ GSM

PLOT 11-2: UPPER BAND EDGE D2 849 MHz GSM

PLOT 11-3 LOWER BAND EDGE A1 824 MHZ TDMA

13 CONCLUSION

The data in this measurement report shows that the Mobile Communications Technologies, Inc. Model BST850, FCC ID: OW5BST850, complies with all the requirements of Part 22 of the FCC Rules and Industry Canada RSS-131.
