Attn: Andy Leimer

Dear Andy,

We are adding data to a filing that you are presently reviewing (OWDTR-0014-E); additional data for SAR and FCC performance tests are reported because hardware changes were made to the J700P radio. The new data was reported to insure that no significant measurement differences would be found between the original report and the newly modified radio. The main item that was changed was the DSP model, from a TI C5402 to a C5416 and a number of discrete components were change in order aid in implementation. Upon completion of the testing, little difference was observed.

In order to prevent confusion please note; in the original report the radio was referred to as the Jaguar 725P, due to marketing considerations we have changed the name to the Jaguar 700P, this is merely administrative no technical difference is meant to be implied.

Regards,
Bryan McWatters
