I, the undersigned, hereby declare that the equipment tested and referenced in this report conforms to the identified standard(s) as described in this test report. No modifications were made to the equipment during testing in order to achieve compliance with these standards. Furthermore, there was no deviation from, additions to, or exclusions from, the applicable parts of FCC Part 2, FCC Part 15, ANSI C63.10, and ISED RSS-247 and RSS-Gen.

1 General Information

1.1 Scope

Applicable Standards

- FCC Rules Part 15.407: Unlicensed National Information Infrastructure Devices - General Technical Requirements
- ISED RSS-247: Digital Transmission Systems (DTSS), Frequency Hopping Systems (FHSS) and Licence-Exempt Local Area Network (LE-LAN) Devices
- ISED RSS-Gen Issue 5 Amendment 1: General Requirements for Compliance of Radio Apparatus

1.2 Description of EUT

Equipment Under Test	Portable Radio
Model / Model #	XL-95P 7/800 MHz Portable Land Mobile Radio
Power Supply	7.4 VDC
Modulation Type	OFDM (802.11a)
Frequency Range	5180 – 5240 MHz, 5745 – 5825 MHz

1.3 Test Facility

The open area test site and conducted measurement facility used to collect the radiated data is located at 360 Herndon Parkway, Suite 1400, Herndon, Virginia 20170.

1.4 Related Submittal(s)/Grant(s)

This is an original certification application for Harris Corporation Model XL-95P 7/800 MHz Portable Land Mobile Radio, Model #/HVIN: XL-x5-7/8, FCC ID: OWDTR-0162-E, IC: 3636B-0162.

1.5 Modifications

No modifications were required for compliance.

2 Test Information

2.1 Description of Test Modes

In accordance with FCC 15.31(m), and because the EUT utilizes an operating band greater than 10 MHz, the following frequencies were tested.

Table 2-1: Channels Tested for Wi-Fi 802.11a

Channel (#)	Frequency (MHz)
36 (U-NII1)	5180
40 (U-NII1)	5200
48 (U-NII1)	5240
149 (U-NII3)	5745
157 (U-NII3)	5785
165 (U-NII3)	5825

2.2 Exercising the EUT

The EUT was tested in all three orthogonal planes in order to determine worst-case emissions. The EUT was provided with software to continuously transmit during testing. The carrier was also checked to verify that information was being transmitted; all modes were investigated and the worst-case mode was used for final testing (48.0 Mbps for U-NII1 and 12.0 Mbps for U-NII3). There were no deviations from the test standard(s) and/or methods. The test results reported relate only to the item tested.

2.3 Test Result Summary

Table 2-2: Test Result Summary – FCC Part 15, Subpart C (Section 15.407); RSS-247, RSS-Gen

FCC	ISED	Test	Result
FCC 15.207	RSS-Gen 8.8	AC Conducted Emissions	Pass
FCC 15.209	RSS-247 6.2; RSS-Gen 6.13	Radiated Emissions	Pass
FCC 15.407(a/1/3)	RSS-247 6.2; RSS-Gen 6.12	Maximum Peak Power Output	Pass
FCC 15.407(a/1/3)	RSS-247 6.2	Power Spectral Density	Pass
FCC 15.407(g)	RSS-Gen 6.11	Frequency Stability	N/A
FCC 15.407(b)(7)	RSS-247 6.2	Band Edge Measurement	Pass
FCC 15.407(b)(6)	RSS-247 6.2	Antenna Conducted Spurious Emissions	Pass
FCC 15.407(a) and (e)	RSS-247 6.2	26 dB and 6dB Bandwidth	Pass
N/A	RSS-Gen 6.7/ TRC-43	99% Bandwidth	Pass

2.4 Tested System Details

The test samples were received on December 10, 2020. The FCC identifiers for all applicable equipment, plus descriptions of all cables used in the tested system, are identified in the following tables.

Table 2-3: Equipment Under Test (EUT)

Part	Manufacturer	Model/ HVIN	Serial Number	FCC ID	RTL Bar Code
Handheld Radio (Conducted)	Harris Corporation	XL-95P 7/800 MHz	A40198E2A016	OWDTR-0162-E	23756
Handheld Radio (Radiated)	Harris Corporation	XL-95P 7/800 MHz	A40198E2A015	OWDTR-0162-E	23758

Table 2-4: Support Equipment

Part	Manufacturer	Model	PN/SN	FCC ID	RTL Bar Code

Table 2-5: Auxiliary Equipment

Part	Manufacturer	Model	PN/SN	FCC ID	RTL Bar Code
Handheld Mic	Harris Corporation	N/A	01HE3327	N/A	23762

2.5 Configuration of Tested System

Figure 2-1: Configuration of System Under Test

3 Peak Output Power – FCC 15.407(a)(1) & (a)(3); RSS-247 6.2, RSS-Gen 6.12

3.1 Power Output Test Procedure

Measurements were obtained radiated at 3 meters with the radiated unit. The corrected dBμV/m level was then corrected back to conducted dBm with the following equation below.

Conversion of dBm to dBμV/m at 3 m:

$$\text{dB}\mu\text{V/m} = \text{dBm} + 104.7 - (20 * \text{LOG}(3\text{m})) = \text{dBm} + 95.2, \text{ or } \text{dBm} = \text{dB}\mu\text{V/m} - 95.2$$

For U-NII1, the FCC limit is 250 mW, and the RSS 247 limit is 200 mW or $10 + 10 * \text{LOG}(\text{OBW } 99\%)$. The most stringent limit shall be used.

$$10 + 10 * \text{LOG}(19.042 \text{ MHz}) = 22.8 \text{ dBm}$$

Highest conducted average power measured: 11.8 dBm = 15.1 mW for U-NII1

$P(\text{Watts}) = 10^{(\text{dBm} / 10)} / 1000$ 5.0 dBm = 3.2 mW for U-NII3

Table 3-1: Power Output Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz-26.5 GHz)	MY51250846	03/18/2021

3.2 Power Output Test Results

Table 3-2: Power Output Test Data – U-NII1 – 802.11a (9.0 Mbps)

Channel (#)	Frequency (MHz)	Conducted Avg. Power (EIRP dBm)	Limit (dBm)	Margin (dB)
36	5180	11.0	22.8	-11.8
40	5200	11.8	22.8	-11.0
48	5240	11.3	22.8	-11.5

Table 3-3: Power Output Test Data – U-NII3 – 802.11a (48.0 Mbps)

Channel (#)	Frequency (MHz)	Conducted Avg. Power (dBm)	Limit (dBm)	Margin (dB)
149	5745	5.0	30.0	-25.0
157	5785	4.3	30.0	-25.7
165	5825	4.5	30.0	-25.5

Measurement uncertainty: ±0.5 dB. This measurement uncertainty is an expanded uncertainty for 95% confidence level received with a coverage factor k=2.

Results: Pass

Date of Test

4 Compliance with the Band Edge – FCC 15.407(b)(7); RSS-247 6.2

4.1 Band Edge Test Procedure

The transmitter output was connected to its appropriate antenna. 1 MHz integrated peak (100 kHz RBW/ 300 kHz VBW) and 1 MHz integrated average (100 MHz RBW/300 kHz VBW) corrected measurements were taken within the restricted band to show compliance.

Table 4-1: Band Edge Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz-26.5 GHz)	MY51250846	03/18/2021

4.2 Restricted Band Edge Test Results

Conversion of dBm to dBμV/m at 3 m:

$$\text{dB}\mu\text{V/m} = \text{dBm} + 104.7 - (20 * \text{LOG}(3\text{m})) = \text{dBm} + 95.2$$

$$54.0 \text{ dB}\mu\text{V/m} - 95.2 = -41.2 \text{ dBm for AVG}$$

$$74.0 \text{ dB}\mu\text{V/m} - 95.2 = -21.2 \text{ dBm for PK}$$

4.1 Band Edge Plots

Plot 4-1: Lower Band Edge – U-NII1 – 802.11a (48.0 Mbps) – Average

Plot 4-2: Lower Band Edge – U-NII1 – 802.11a (48.0 Mbps) – Peak

Plot 4-3: Upper Band Edge - U-NII1 - 802.11a (48.0 Mbps) - Average

Plot 4-4: Upper Band Edge – U-NII1 – 802.11a (48.0 Mbps) – Peak

Plot 4-5: Lower Band Edge – Average – U-NII3 – 802.11a (12.0 Mbps)

5 Antenna Conducted Spurious Emissions – FCC 15.407(b)(6); RSS-247 6.2

5.1 Antenna Conducted Spurious Emissions Test Procedures

Antenna conducted spurious emissions per FCC 15.407(b)(6) were measured from the EUT antenna port using a 50-ohm spectrum analyzer with the resolution bandwidth set at 1 MHz, and the video bandwidth set at $>3 \times \text{RBW}$.

Table 5-1: Antenna Conducted Spurious Emissions Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz-26.5 GHz)	MY51250846	03/18/2021

5.2 Antenna Conducted Spurious Emissions Test Results

No harmonics or spurs were found within 20 dB (note that we are reporting power as peak) of the carrier level from the carrier to the 10th harmonic of the carrier frequency.

Measurement uncertainty: ± 0.5 dB. This measurement uncertainty is an expanded uncertainty for 95% confidence level received with a coverage factor $k=2$.

Results: Pass

6 Bandwidths – FCC 15.407(a) and (e); RSS-247 6.2; RSS-Gen 6.7

6.1 Bandwidth Test Procedure

The minimum 6 dB, 26 dB and 99% bandwidths per FCC 15.407(a) and (e), RSS-247 6.2 and RSS-Gen 6.7 were measured using a 50-ohm spectrum analyzer with the resolution bandwidth set approximately 1% of the emission bandwidth, and the video bandwidth set > RBW.

Table 6-1: Bandwidth Test Equipment

RTL Asset #	Manufacturer	Model	Part Type	Serial Number	Calibration Due Date
901583	Agilent Technologies	N9010A	EXA Signal Analyzer (10 Hz-26.5 GHz)	MY51250846	03/18/2021

7 Power Spectral Density – FCC 15.407(a)(1) & (a)(3); RSS-247 6.2

7.1 Power Spectral Density Test Procedure

The power spectral density per FCC 15.407(a)(1)(3) was measured using a 50-ohm spectrum analyzer. The spectral lines were resolved for the modulated carriers. These levels are below the limits. See the power spectral density table and plots.

8 Frequency Stability – FCC 15.407(g); RSS-Gen 6.11

8.1 Frequency Stability Test Procedure

The EUT was placed inside the temperature chamber and supplied by nominal 7.4 VDC. The EUT was connected to an analyzer which was located outside of the chamber. The temperature was set to the lowest level of -20.0°C and the EUT was allowed to stabilize with power off for a period of 1 hour. The EUT was then powered up and the frequency was measured. This was continued at +20.0°C and +50.0°C. The chamber was allowed to stabilize between measurements for approximately 30 minutes. At +20.0°C, the EUT supply voltage was adjusted to 85% (6.29 VDC) and 115% (8.51 VDC) of the nominal voltage, and the frequency was recorded.

9 AC Conducted Emissions – FCC 15.207; RSS-Gen 8.8

9.1 Conducted Emissions Test Procedure

The powerline conducted emissions measurement were performed in a Series 81 Type shielded enclosure manufactured by Rayproof. The EUT was assembled on a wooden table 80 cm high. Power was fed to the EUT through a 50 Ω / 50 μ H Line Impedance Stabilization Network (LISN). The EUT LISN was fed power through an AC filter box on the outside of the shielded enclosure. The filter box and EUT LISN housing are bonded to the ground plane of the shielded enclosure. A second LISN, the peripheral LISN, provides isolation for the EUT test peripherals. This peripheral LISN was also fed AC power. A metal power outlet box, which is bonded to the ground plane and electrically connected to the peripheral LISN, powers a DC power supply which powers the EUT.

The spectrum analyzer (SA) was connected to the AC line through an isolation transformer. The 50 Ω output of the LISN was connected to the SA input through a Solar 100 kHz high-pass filter. The filter is used to prevent overload of the SA from noise below 100 kHz. Conducted emission levels were measured on each current-carrying line with the SA operating in the CISPR quasi-peak (QPK) mode or peak (PK) mode if applicable.

The SA's 6 dB bandwidth was set to 9 kHz. Video bandwidth (VBW) filter less than 10 times the resolution bandwidth (RBW) is not used. Average (AVG) measurements are performed in linear mode using a 10 kHz RBW, 1 Hz VBW, and by increasing the sweep time in order to obtain a calibrated measurement. The emission spectrum was scanned from 150 kHz to 30 MHz. The highest emission amplitudes relative to the appropriate limits were measured and recorded.

Rate 802.11a 9 Mbps was chosen for U-NII1 and 48 Mbps for U-NII3.

9.2 Conducted Emissions Limits

10 Radiated Emissions – FCC 15.209; RSS-247 6.2; RSS-Gen 6.13/7.1

10.1 Limits of Radiated Emissions Measurement

Frequency (MHz)	Field Strength (μV/m)	Measurement Distance (m)
0.009-0.490	2400/f (kHz)	300
0.490-1.705	2400/f (kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

As shown in 15.35(b), for frequencies above 1000 MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20 dB under any circumstances of modulation.

10.2 Radiated Emissions Measurement Test Procedure

Before final measurements of radiated emissions were made on the open-field three/ten meter range, the EUT was scanned indoors at one and three meter distances. This was done in order to determine its emissions spectrum signature. The physical arrangement of the test system and associated cabling was varied in order to determine the effect on the EUT's emissions in amplitude, direction and frequency. This process was repeated during final radiated emissions measurements on the open-field range, at each frequency, in order to ensure that maximum emission amplitudes were attained.

Final radiated emissions measurements were made on the three/ten-meter, open-field test site. The EUT was placed on a nonconductive turntable 0.8 meters above the ground plane. The spectrum was examined from 9 kHz to the 10th harmonic of the highest fundamental transmitter frequency (24.8 GHz).

At each frequency, the EUT was rotated 360°, and the antenna was raised and lowered from 1 to 4 meters in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations. For frequencies between 30 and 1000 MHz, the spectrum analyzer's 6 dB bandwidth was set to 120 kHz, and the analyzer was operated in the CISPR quasi-peak detection mode. For emissions above 1000 MHz, emissions are measured using the average detector function with a minimum resolution bandwidth of 1 MHz. No video filter less than 10 times the resolution bandwidth was used. The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

Conversion of dBm to dBμV/m at 3 m:

$$\text{dB}\mu\text{V/m} = \text{dBm} + 104.7 - (20 * \text{LOG}(3\text{m})) = \text{dBm} + 95.2$$

500.000	QPK	V	180	2.5	38.1	-8.4	29.7	46.0	-16.3	Pass

Measurement uncertainty: ±4.6 dB. This measurement uncertainty is an expanded uncertainty for 95% confidence level received with a coverage factor k=2.

Results: Pass

11 Conclusion

The data in this NII measurement report shows that the EUT as tested, Harris Corporation XL-95P 7/800 MHz Portable Land Mobile Radio, Model #/HVIN XL-x5-7/8, FCC ID: OWDTR-0162-E, IC: 3636B-0162, complies with the applicable requirements of FCC Parts 2 and 15 and ISSED RSS-247 and RSS-Gen.
