

Difference Statement

Model: EMC3589-D, EMC3589-S

The two types of modules are the same except for the antenna. Therefore, use the module with higher antenna gain to measure the radiation spurious emissions, and then determine the power level. For the module with lower antenna gain, use this power level to verify the radiation spurious emissions. Once both radiation spurious emissions tests are passed, use the module with higher antenna gain to measure the conducted emissions.
