Verification Of Compliance

COMPANY NAME : WG SECURITY PRODUCTS, INC.
161 SAN LAZARO AVENUE
SUNNYVALE, CA 94086, USA

CONTACT PERSON : GRAHAM HANDYSIDE / VICE PRESIDENT

TELEPHONE NO : (408) 530-8070

MODEM NAME : MONO GUARD AND MULTI-GUARD

DATE TESTED : DECEMBER 12, 2001 AND APRIL 19, 2002

LIMIT APPLY TO : FCC PART 15 SECTION 15.209

TECHNICAL LIMITS	TEST RESULT
Restricted Band of Operation	Passed

LIMIT APPLY TO : FCC PART 15 SECTION 15.207

AC Line Conducted Emission	Passed
----------------------------	--------

The above equipment was tested by Compliance Engineering Services Inc. for compliance with the requirement set forth in the requirements of CFR 47 PART 15 SUBPART C. This said equipment in the configuration described in this report, shows the maximum emission levels emanating from equipment are within the compliance requirements.

Tested By:

Approved & Released For CCS By:

COMPLIANCE CERTIFICATION SERVICES

SECTION 1: LABORATORY INFORMATION

1.1 General Condition:

This report contains an assessment of an apparatus against Electromagnetic Interference Technical Requirements based upon tests carried out on the samples submitted.

With regard to this assessment, the following points should be noted:

- a) The results of testing in this report apply to the product/system which was tested only. Other similar equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties. ent reports conditions under which testing was conducted and results of tests performed. This document may not be altered or revised in any way unless done so by Compliance Certification Services and all revisions are duly noted in the revisions section.
- b) The apparatus was set up and exercised using the configurations, modes of operation and arrangements defined in this report only.
- c) Where relevant, the apparatus was only assessed using the susceptibility criteria defined in this report .
- d) All testing was performed under the following environmental conditions:
 - Temperature 15°C to 35°C (54°F to 95°F)
 - Atmospheric Pressure 860mbar to 1060mbar (25.4" to 31.3")
 - Humidity 10% to 75*%

Taiwan	BSMI	CNS 13438	 SL2-IN-E-1012
Canada	Industry Canada	RSS210 Low Power Transmitter and Receiver	 IC2324 A,B,C, and F

*No part of this report may be used to claim or imply product endorsement by NVLAP or any agency of the US Government

1.4 Measurement Uncertainty

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the apparatus:

Radiated Emission	
30MHz – 200 MHz	+/- 3.3dB
200MHz – 1000MHz	+4.5/-2.9dB
1000MHz – 2000MHz	+4.6/-2.2dB
Power Line Conducted Emission	
150kHz – 30MHz	+/-2.9

Any results falling within the above values are deemed to be marginal.

1.5 Deviation from measurement specification

Not Applicable

1.6 Measurement Instrument Calibration

The measuring equipment which was utilized in performing the tests documented herein has been calibrated in accordance with the manufacturer's recommendations for utilizing calibration equipment which is traceable to recognized national standards.

SECTION 2: PRODUCT INFORMATION

2.1 Product Description:

The Mono-Guard and Multi Guard are software driven EAS system that works in combination with any 58kHz tag. The system receiver listens for the unique signal that any 58kHz tag produces, and the sequence produced is then verified and multiplied in a fraction of a second. When the presence of a 58kHz tag is identified, this will alarm the system. Eliminating false alarms entirely is the intent of our design.

For the Mono-Guard, the transmitter and receiver are integrated in the same pedestal. For the Multi-Guard, the transmitter and receiver contained in separate pedestals. The circuitry and printed wiring boards are identical only the layout of assemblies changes between Mono-Guard and Multi-Guard.

The Multi-Guard system can operate at a higher level of sensitivity, resulting in an excellent detection rate of up to 2.8 meters (9 feet) between two pedestals.

2.2 Power Requirements

AC	120-230V, 50-60Hz
DC	N/A
Battery Power	N/A
AC-DC Adaptor	N/A

2.3 Local Osc. Or Crystal:

Board Name	Local Osc. / Crystal (MHz)
Main	11.6
Communication	3.712

2.4 Serial Number

Not Applicable

SECTION 3: TEST SUMMARY

3.1 Applicable Electromagnetic Interference Requirements:

Radiated Emission Technical Requirements 15.209		
Frequency (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(KHz)	300
0.490-1.705	24000/F(KHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

Conducted Emission Technical Requirements 15.207	
Frequency Range	FCC limits Quasi-Peak/dBuV
450kHz-0.5 MHz	48

3.2 Sample received date and Test Period:

Mono-Guard

Sample received date	11/9/01
Test Period	From 11/9/01 To 12/18/01

Multi-Guard

Sample received date	4/8/02
Test Period	From 4/8/02 To 4/19/02

3.3 Engineering Justification:

DURING TEST SOME MODIFICATIONS WERE MADE TO ACHIEVE THE LIMIT.

1. Two ferrite cores were added to the transmitter board to the antenna.
The ferrite is model number 32866WG from WG Security.
2. A third ferrite core was added to the controller card to the main board.
The ferrite model number is 0444164181 from Fair-Rite.
- 3a. For the Mono-Guard, a shielding plate was added to the AC to DC power board.
- 3b. For the Multi-Guard, a shielding plate was added to the AC to DC power board in transmitter unit.

SECTION 4 ELECTROMAGNETIC INTERFERENCE TEST

Test Configuration:

Software Used During The Tests	
File Name	☐ EMCTEST ☐ Pinging ☐ Read & Write ☐ Terminal ☐ Music ☐ Joy-Stick ☒ Other: None
Program Sequence	N/A

Mode of Operational Investigated:

Worse Case Emission Levels			
Mode of Operation		Radiated Emission	Conducted Emission

4.1 Radiated Emission Test Procedures

The EUT and all other support equipment were placed on a wooden table 80 cm above the ground screen. The antenna to EUT distance was 10 meters. During the test, the table was rotated 360 degrees to maximize emissions and the antenna was positioned from 1 to 4 meters above the ground screen to further maximize emissions. Measurements were made with the antenna polarized in both the vertical and the horizontal positions.

The EUT test configuration was according to Section 8 of ANSI C63.4/1992.

The following procedure was used to make the measurements: The frequency range of interest was monitored at a fixed antenna height and EUT azimuth. The Frequency span was set small enough to easily differentiate between broadcast stations, intermittent ambient signals and EUT emissions. The EUT was rotated through 360 degrees to maximize emissions received. During the rotation if emission increased by more than 1 dB, or if another emission appeared that was greater by 1 dB, the EUT was returned to the azimuth where the maximum occurred, and additional cable manipulation was performed to further maximize received emissions.

The antenna was moved up and down to further maximize the suspected highest amplitude signal. If the emission increased by 1 dB or more, or if another emission appeared that was greater by 1dB or more, the antenna was returned to the height where maximum signal was observed, and, cables were manipulated to produce highest emissions, noting frequency and amplitude.

4.1.1 Instrument Setting

Frequency Range	Instrument	Detector Function	Resolution Bandwidth	Video Bandwidth
30 - 1000 MHz	EMI Receiver	Quasi-Peak	120kHz	N/A
30 – 1000 MHz	Spectrum Analyzer	Peak	100kHz	100kHz
Above 1000 MHz	Spectrum Analyzer	Peak	1 MHz	1 MHz

4.2 Conducted Emission Test Procedures

The EUT was setup and located so that the distance between the boundary of the EUT and the closest surface to the LISN was 0.8m or more.

EUT test configuration was according to Section 7 of ANSI C63.4/1992.

Conducted disturbance was measured between the phase lead and the ground, and between the neutral lead and the ground. The frequency 0.450 - 30 MHz was investigated.

The EMI receiver was set to PEAK detector setting, and swept continuously over the frequency range to be investigated. The resolution bandwidth was set to 9kHz minimum. The EMI receiver input cable was connected to LINE 1 RF measurement connection on the LISN. A 50ohm terminator was connected to the unused RF port on the LISN. For each mode of EUT operation, emissions readings were maximized by manipulating cable and wire positions. The configuration for each EUT power cord which produced emissions closest to the limit was recorded. The same procedure was repeated for LINE 2 of each EUT power cord.

4.2.1 Instrument Settings

Antenna, LP	EMCO200 - 2000MHz	3146	9107-3163	8/2/02
Line Filter	Lindgren 10k - 10GHz	LMF-3489	497	N.C.R.
LISN	Fisher Cus. Comm.	LISN-50/250-25-2	2023	8/2/02
EMI Test Receiver	Rohde & Schwarz	ESHS 20	827129/006	4/2/02
Active Loop Antenna, (10K - 30MHz)	EMCO	6502	9202-2722	2/18/02

4.3.4 Below 30MHz Emission Test Setup photos Mono-Guard

4.3.5 Below 30MHz Emission Test Results Mono-Guard

WG Security Products ,INC.
58kHz Article Surveillance System
Test to: FCC-15.209
Test distance: 10 meter measurement
Model Name: Mono-Guard

Frequency	QP	AF	CL	D.C.	Corrected Reading	Limit	Margin
(MHz)	(dBuV)	(dB)	(dB)	(dB)	(dBuV/m)	(dBuV/m)	(dB)
0.058	46.5	9.5	0.1	-59	-2.9	32.34	-35.24
0.117	38	8.7	0.1	-59	12.2	26.26	-38.46
0.174	36	8.7	0.1	-59	-14.2	22.79	-36.99
0.29	37	8.7	0.1	-59	-13.2	18.36	-31.56
0.35	26	8.7	0.1	-59	-24.2	16.72	-40.92
0.405	35.4	8.7	0.2	-59	-14.7	15.46	-30.16
0.522	32.2	8.7	0.2	-19	22.1	33.25	-11.15
0.638	22.2	8.7	0.2	-19	12.1	31.51	-19.41
0.985	22.6	8.7	0.3	-19	12.6	27.73	-15.13
1.395	23	9	0.3	-19	13.3	24.71	-11.41

Q.P. = Quasi Peak Readings

A.F. = Antenna factor

C.L. = Cable Loss

* Distance Correction factor below 30MHz = $40 \cdot \log(\text{new test distance/original limit distance})$

$40 \cdot \log(10/300) = -59$

$40 \cdot \log(10/30) = -19$

* Worst Case readings is when EUT is facing the Antenna in the Horizontal position.

Multi-Guard
