Other support units were connected to the power mains through another LISN. The two LISNs provide 50 ohm/ 50uH of coupling impedance for the measuring instrument.
- b. Both lines of the power mains connected to the EUT were checked for maximum conducted interference.
- c. The frequency range from 150kHz to 30MHz was searched. Emission levels under Limit - 20dB was not recorded.

4.1.4 DEVIATION FROM TEST STANDARD

No deviation

4.1.5 TEST SETUP

- Note:**
1. Support units were connected to second LISN.
 2. Both of LISNs (AMN) are 80 cm from EUT and at least 80 from other units and other metal planes

For the actual test configuration, please refer to the related item – Photographs of the Test Configuration.

4.1.6 EUT OPERATING CONDITIONS

- a. Connected the EUT with the notebook system by RJ45 cable and placed on a testing table.
- b. Prepared the notebook computer and placed it outside of testing area to act as communication partner for EUT.
- c. The communication partner ran a test program (provided by manufacturer) to enable EUT under transmission/receiving condition continuously at specific channel frequency.
- d. The notebook system displayed "H" messages on its screen.
- e. The notebook system sent "H" messages to printer and the printer prints them on paper.
- f. The notebook system sent "H" messages to the modem.
- g. Steps d ~ f were repeated.

- REMARKS:**
1. Q.P. and AV. are abbreviations of quasi-peak and average individually.
 2. "-": The Quasi-peak reading value also meets average limit and measurement with the average detector is unnecessary.
 3. The emission levels of other frequencies were very low against the limit.
 4. Margin value = Emission level - Limit value
 5. Correction factor = Insertion loss + Cable loss
 6. Emission Level = Correction Factor + Reading Value.

4.2 RADIATED EMISSION MEASUREMENT

4.2.1 LIMITS OF RADIATED EMISSION MEASUREMENT

Emissions radiated outside of the specified bands, shall be according to the general radiated limits in 15.209 as following:

Frequencies (MHz)	Field strength (microvolts/meter)	Measurement distance (meters)
0.009-0.490	2400/F(kHz)	300
0.490-1.705	24000/F(kHz)	30
1.705-30.0	30	30
30-88	100	3
88-216	150	3
216-960	200	3
Above 960	500	3

NOTE:

1. The lower limit shall apply at the transition frequencies.
2. Emission level (dBuV/m) = 20 log Emission level (uV/m).
3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.

4.2.3 TEST PROCEDURES

- a. The EUT was placed on the top of a rotating table 0.8 meters above the ground at a 3 meters semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. The antenna is a broadband antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f. If the emission level of the EUT in peak mode was lower than the limit specified, then testing could be stopped and the peak values of the EUT would be reported. Otherwise the emissions would be re-tested one by one using peak, quasi-peak or average method as specified and then reported in a data sheet.

NOTE:

1. The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 120kHz for Peak detection (PK) and Quasi-peak detection (QP) at frequency below 1GHz.
2. The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 1 MHz for Peak detection at frequency above 1GHz.
3. The resolution bandwidth of test receiver/spectrum analyzer is 1MHz and the video bandwidth is 10Hz for Average detection (AV) at frequency above 1GHz.

NOTE 1: The band edge emission plot of DSSS technique on the next page shows 51.84dBc between carrier maximum power and local maximum emission in restrict band (2.386091000GHz). The emission of carrier strength list in the test result of channel 1 at the item 4.2.7 is 112.16dBuV/m (Peak), so the maximum field strength in restrict band is $112.16 - 51.84 = 60.32\text{dBuV/m}$ which is under 74dBuV/m limit.

The band edge emission plot of DSSS technique on the next page shows 54.69dBc between carrier maximum power and local maximum emission in restrict band (2.386091000GHz). The emission of carrier strength list in the test result of channel 1 at the item 4.2.7 is 107.58dBuV/m (Average), so the maximum field strength in restrict band is $107.58 - 54.69 = 52.89\text{dBuV/m}$ which is under 54dBuV/m limit.

NOTE 2: The band edge emission plot of DSSS technique on the next second page shows 53.82dBc between carrier maximum power and local maximum emission in restrict band (2.487740000GHz). The emission of carrier strength list in the test result of channel 11 at the item 4.2.7 is 112.33dBuV/m (Peak), so the maximum field strength in restrict band is $112.33 - 53.82 = 58.51\text{dBuV/m}$ which is under 74dBuV/m limit.

The band edge emission plot of DSSS technique on the next third page shows 61.11dBc between carrier maximum power and local maximum emission in restrict band (2.488540000GHz). The emission of carrier strength list in the test result of channel 11 at the item 4.2.7 is 107.33 dBuV/m (Average), so the maximum field strength in restrict band is $107.33 - 61.11 = 46.22\text{dBuV/m}$ which is under 54dBuV/m limit.

NOTE 1: The band edge emission plot of OFDM technique on the next page shows 45.91dBc between carrier maximum power and local maximum emission in restrict band (2.372000000GHz). The emission of carrier strength list in the test result of channel 1 at the item 4.2.7 is 104.65dBuV/m (Peak), so the maximum field strength in restrict band is $104.65 - 45.91 = 58.74\text{dBuV/m}$ which is under 74dBuV/m limit.

The band edge emission plot of OFDM technique on the next page shows 50.83dBc between carrier maximum power and local maximum emission in restrict band (2.372000000GHz). The emission of carrier strength list in the test result of channel 1 at the item 4.2.7 is 94.67dBuV/m (Average), so the maximum field strength in restrict band is $94.67 - 50.83 = 43.84\text{dBuV/m}$ which is under 54dBuV/m limit.

NOTE 2: The band edge emission plot of OFDM technique on the next second page shows 44.88dBc between carrier maximum power and local maximum emission in restrict band (2.488500000GHz). The emission of carrier strength list in the test result of channel 11 at the item 4.2.7 is 104.82dBuV/m (Peak), so the maximum field strength in restrict band is $104.82 - 44.88 = 59.94\text{dBuV/m}$ which is under 74dBuV/m limit.

The band edge emission plot of OFDM technique on the next third page shows 56.11dBc between carrier maximum power and local maximum emission in restrict band (2.483500000GHz). The emission of carrier strength list in the test result of channel 11 at the item 4.2.7 is 95.89dBuV/m (Average), so the maximum field strength in restrict band is $95.89 - 56.11 = 39.78\text{dBuV/m}$ which is under 54dBuV/m limit.
