

Vyyo Inc.**FCC ID:** PBJV3000-C**FCC Rule Part: 27**

Section 27.5(c) Block C: 740–746 MHz

General Overview

A description of the theory of operation and product configuration is found in an attachment to this application and report.

SPECIFICATIONSTransmitter

TX operating frequency:	741-745 MHz
TX output power:	64.1 watts Peak/ 17 watts Average
Digital Modulation:	64QAM in 1.75 MHz channel Modulation is internally generated and limited
Power requirements:	120 VAC or 48 VDC
Antenna connector:	N- type
Frequency Tolerance	Remain in band: -30 to +50 C 85%-115% supply voltage at 20C

Block diagram and theory of operation is provided in a separate attachment.

Test Summary Results

Test Description	Plot or Table No.	Test Results
RF Power Output	Plots 1- 4	Pass
Occupied Bandwidth	Plots 5 - 7	Pass
Spurious and Harmonic Emissions at Antenna Terminals	Plots 8-10	Pass
Field Strength of Spurious and Harmonic Radiation	Table 1-3	Pass
Frequency Stability	Plots 11-17	Pass

FCC CERTIFICATION INFORMATION

The following information is in accordance with FCC Rules, 47CFR Parts 1 and 2.

1.1307(b) RF exposure information is provided in a separate attachment in the form of maximum permissible exposure (MPE) data.

2.1033(c)1 Applicant: Vyyo Inc.
4015 Miranda Avenue
Palo Alto, CA. 94304

2.1033(c)2 FCC ID: [PBJV3000-C](#)

2.1033(c)3 Installation instructions are found in separate document.

2.1033(c)4 Emission type: 64QAM
Emission designator: 1M52W1D

2.1033(c)5 Frequency range: 741-745 MHz

2.1033(c)6 Range of Operating Power

64.1 watts Peak/ 17 watts Average Maximum, variable in 1 dB steps

2.1033(c)7 Maximum Power Rating

64.1 watts Peak/ 17 watts Average

Maximum allowed per Section 27.50(c)1: 50 kW ERP

2.1033(c)8 Applied voltages and currents into the final transistor elements

Refer to schematics, separate submission accompanying this application

2.1033(c)9 Tune-up procedure

Refer to installation instructions.

2.1033(c)10 Circuit and Functional Block Diagram, Description of Circuitry

Product schematics are provided in separate attachments.

Circuit description and theory of operation are found in separate attachment.

2.1033(c)11 FCC ID Label

Refer to separate attachment.

2.1033(c)12 Product Photographs

Refer to separate attachment.

2.1033(c)13 Description of Modulation System

64QAM produced by internal DOCSIS cable modem

2.1033(c)14 Test Data per 2.1046 – 2.1057

Test Equipment List

TEST EQUIPMENT LIST				
Name of Equipment	Manufacturer	Model No.	Serial No.	Due Date
EMI Receiver, 9 kHz ~ 2.9 GHz	HP	8542E	3942A00286	3/29/06
RF Filter Section	HP	85420E	3705A00256	3/29/06
Antenna, Bilog 30MHz ~ 2Ghz	Sunol Sciences	JB1	A121003	3/3/06
Signal Generator 2 -40 GHz	R & S	SMP04	DE 34210	6/8/06
Antenna, Horn 1 ~ 18 GHz	EMCO	3115	2238	4/22/06
Antenna, Horn 1 ~ 18 GHz	EMCO	3115	6717	4/22/06
Antenna, Horn 1 ~ 18 GHz	ETS	3117	29310	4/22/06
Peak Power Meter	Agilent	E4416A	GB41291160	2/9/06
Peak / Average Power Sensor	Agilent	E9327A	US40440755	2/10/06
Spectrum Analyzer 3 Hz ~ 44 GHz	Agilent	E4446A	US42070220	1/1/06
Temperature / Humidity Chamber	Thermotron	SE 600-10-10	29800	6/10/06

2.1046 RF Output Power Measurements

Test set-up:

Figure 1

Total offset: 20 dB + 30 dB + 2 dB = 52 dB

Test Procedures

The transmitter was set to produce the required 64QAM modulation. The spectrum analyzer was set to measure total channel power for LOW, MID, and HIGH channels.

Test Results

Maximum results were 64 watts Peak, 17 watts Average.
Refer to spectrum analyzer plots below.

Plot#1 - Low Channel Output Power, AVERAGE

Plot#2 - Low Channel Output Power, PEAK

Plot#3 - Mid Channel Output Power

Plot#4 -High Channel Output Power

**Section 2.1049 Occupied Bandwidth
Requirement/Limit: 22.531**

Test set-up: Refer to Figure 1, above

Test Procedures:

Using the spectrum analyzer Occupied Bandwidth measurement function, the 99% occupied bandwidth was measured for the EUT at LOW, MID, and HIGH channels with the EUT operating at full rated power.

Test Results:

Refer to spectrum analyzer displays below.

Plot#5 - LOW Channel Occupied Bandwidth

Plot#6 - MID Channel Occupied Bandwidth

Plot#7 - HIGH Channel Occupied Bandwidth

Section 2.1051 Spurious and Harmonic Emissions at Antenna Terminals**Requirement/Limit: 27.53(f)**

(f) For operations in the 698–746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed.

Test set-up: Refer to Figure 1, above

Test Procedures

1. Set the EUT to produce maximum power at LOW channel.
2. Set spectrum analyzer REF LEVEL OFFSET to total of cable loss and attenuator losses.
3. Set the spectrum analyzer to $RBW=VBW > 100$ kHz
4. Set display line to -13 dBm (30 dBm/W + $10 \log P$ watts – $(43+10\log P_{\text{watts}})$)
5. Scan from lowest frequency generated by EUT to 10^{th} harmonic.

Test Results

PASS. Refer to spectrum analyzer plots below.

Plot#8A - LOW Channel Spurious Emissions, Antenna Conducted Output

Plot#8B - LOW Channel Bandedge Emissions, Antenna Conducted Output

Plot#9 - MID Channel Spurious Emissions, Antenna Conducted Output

Plot#10A - HIGH Channel Spurious Emissions, Antenna Conducted Output

Plot#10B - HIGH Channel Bandedge Emissions, Antenna Conducted Output

Section 2.1053 Field Strength of Spurious and Harmonic Radiation**Requirement: 27.53(f)**

(f) For operations in the 698–746 MHz band, the power of any emission outside a licensee's frequency band(s) of operation shall be attenuated below the transmitter power (P) within the licensed band(s) of operation, measured in watts, by at least $43 + 10 \log (P)$ dB. Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 100 kilohertz or greater. However, in the 100 kilohertz bands immediately outside and adjacent to a licensee's frequency block, a resolution bandwidth of at least 30 kHz may be employed.

Test Set-Up : Spurious and harmonic emissions measurements

Test Setup: Substitution antenna and signal generator**Figure 2b****Minimum Requirement**

-13 dBm EIRP beyond 250% of authorized bandwidth

Test Method

The antenna output port of the EUT was terminated with a 50 ohm load. With the transmitter operating at full power, the EUT was rotated 360° and the search antenna was raised and lowered in both polarities, all in an attempt to maximize the levels of the received emission for each harmonic and spurious emission up to 10 fo.

The EUT was removed and was replaced by a substitution antenna connected via coax to a signal generator. The generator output was set to each emission frequency detected, the search antenna was raised and lowered, the turntable was rotated, until the maximum emission level was obtained. The signal generator output level was adjusted to match the radiated emission level from the EUT. After correcting for substitution antenna factor and generator cable loss, output power level is compared to the limit.

Test Results

Pass. All emissions detected were below -13 dBm EIRP. Refer to test data below.

2.1055 Frequency Stability

Requirement/Limit: Section 27.54

27.54. The frequency stability shall be sufficient to ensure that the fundamental emissions stay within the authorized bands of operation.

Test Setup

Figure 3

Test Procedures

1. The WMTS modulator and the frequency up-converter portions of the transmitter were placed inside the temperature chamber. These are the two subassemblies that determine the operating frequency of the EUT.
2. The output of the U/C was connected to the spectrum analyzer through the same attenuators and coaxial cable used for the other antenna port conducted tests for a total attenuation of 52 dB.
3. The temperature was set to 25C and a plot of the transmitter output mask was recorded (yellow trace) The temperature was allowed to stabilize at every 10 degrees C from -30C to +50C. For each temperature tested a second output mask plot (blue trace) was superimposed on the yellow 25C plot.

Test Results

From +10C - +50C the EUT output mask did not vary noticeably from the 25C plot. The EUT is designed for indoor operation in a climate protected room. A temperature sensitive switch turns off the TX power when temperature goes below 10C and there is no TX output.

Refer to attached spectrum analyzer photos.

Plot#11 - T= 50°C

Plot#12 - T= 40°C

Plot#13 - T= 30°C

Plot#14 - T= 20°C

Plot#15 - T= 10°C

Operating Voltage v Frequency

Test Setup

Refer to Figure 3

Test Procedures

At 25C the power supply voltage was varied between 85% and 115% nominal.

Test Results

No detectable variation. over voltage excursion.

Plot#16 - T= 25°C, V = 102 VAC (85% nominal)

Plot#17 - T= 25°C, V = 102 VAC (115% nominal)

Test Location: Compliance Certification Services
561 F Monterey Road
Morgan Hill CA 95037

Test Dates: 22 September – 4 October 2005

All testing was performed at Compliance Certification Services either by me or under my supervision. Conducted and radiated emissions were performed using test equipment with calibration traceable to NIST, and following test procedures accepted by the industry.

A handwritten signature in blue ink, reading "T. N. Cokenias", with a long horizontal flourish extending to the right.

THOMAS N. COKENIAS
Consultant, EMC&Radio Type Approvals
Agent for Vyyo Inc.
