

TEST REPORT FROM RADIO FREQUENCY INVESTIGATION LTD.

Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 2000
(Intentional Radiators)
Section 15.247

Test Report Serial No:
RFI/MPTB1/RP42493B

This Test Report Is Issued Under The Authority Of Richard Jacklin, Operations Director: 	Checked By: 
Tested By: 	Release Version No: PDF01
Issue Date: 31 October 2001	Test Dates: 11 October 2001 to 18 October 2001

This report is issued in Adobe Acrobat portable document format (PDF). It is only a valid copy of the report if it is being viewed in PDF format with the following security options not allowed: Changing the document, Selecting text and graphics, Adding or changing notes and form fields. Furthermore, the date of creation must match the issue date stated above.
This report may be copied in full.

1. Client Information

Company Name:	Red-M (Communications) Ltd.
Address:	Wexham Springs Framewood Road Wexham Slough SL3 6PJ.
Contact Name:	Mark Bailey

Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

2. Equipment Under Test (EUT)

The following information (with the exception of the Date of Receipt) has been supplied by the client:

2.1. Identification Of Equipment Under Test (EUT)

Brand Name:	Red-M
Model Name or Number:	Bluetooth Module for Visor
Unique Type Identification:	Bluetooth Module for Visor
Serial Number:	158-228-03 PCA XX (integral antenna) & PCA 40 (conducted test port)
Country of Manufacture:	UK
FCC ID Number:	None stated
Date of Receipt:	11 October 2001

2.2. Description Of EUT

The equipment under test is a plug in Bluetooth module for Handspring Visor personal digital assistants (PDAs).

2.3. Modifications Incorporated In EUT

The EUT has not been modified from what is described by the Model Name and Unique Type Identification stated above.

**Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor**

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

2.4. Additional Information Related To Testing

Power Supply Requirement:	Internal battery supply of 3.3 V DC (in PDA)
Intended Operating Environment:	Commercial, Light industry
Weight:	0.1 kg
Dimensions:	50 x 55 x 5 mm
Interface Ports:	1 x 68 way PCMCIA connector (enclosed)

Test Of: Red-M (Communications) Ltd.

Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

2.5. Support Equipment

The following support equipment was used to exercise the EUT during testing:

Description:	Personal Digital Assistant
Brand Name:	Handspring
Model Name or Number:	Visor Platinum
Serial Number:	AEBEB04910939
FCC ID Number:	None
Cable Length And Type:	N/A
Connected to Port:	N/A

Description: (as used in schematic)	Radio Tester
Brand Name:	Red-M
Model Name or Number:	None given
Serial Number:	000281FF0400A8
FCC ID Number:	None
Cable Length And Type:	Mains 2.3m, 1m CAT 5 UTP
Connected to Port:	Mains input, 10/100 office LAN

Description: (as used in schematic)	Personal Computer
Brand Name:	Dell
Model Name or Number:	Lattitude CP M233XT
Serial Number:	0009321C-12800-840-2517
FCC ID Number:	None given.
Cable Length And Type:	2m power, 1m CAT 5 UTP
Connected to Port:	Power input, Ethernet port

3. Test Specification, Methods And Procedures

3.1. Test Specification

Reference:	FCC Part 15 Subpart C: 2000 (Section 15.247, 15.205 and 15.209)
Title:	Code of Federal Regulations, Part 15 (47CFR15) Radio Frequency Devices: Digital Devices.
Comments:	A description of the test facility used for this test is on file with, and has been accepted by, the Federal Communications Commission as required by Section 2.948 of Federal Rules.
Purpose of Test:	To determine whether the equipment complied with the requirements of the specification for the purposes of certification.

3.2. Methods And Procedures

The methods and procedures used were as detailed in:

FCC Code of Federal Regulations 47.

Telecommunication. Parts 0 to 19, October 2000.

ANSI C63.2 (1987)

Title: American National Standard for Instrumentation - Electromagnetic noise and field strength.

ANSI C63.4 (1992)

Title: American National Standard Methods of Measurement of Electromagnetic Emissions from Low Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz.

ANSI C63.5 (1988)

Title: American National Standard for the Calibration of antennas used for Radiated Emission measurements in Electromagnetic Interference (EMI) control.

ANSI C63.7 (1988)

Title: American National Standard Guide for Construction of Open Area Test Sites for performing Radiated Emission Measurements.

CISPR 16-1: (1999)

Title: Specification For Radio Disturbance and Immunity Measuring Apparatus and Methods. Part 1: Radio Disturbance and Immunity Measuring Apparatus.

3.3. Definition Of Measurement Equipment

The measurement equipment used complied with the requirements of the standards referenced in the Methods & Procedures section above. Appendix 1 contains a list of the test equipment used.

RADIO FREQUENCY INVESTIGATION LTD.

TEST REPORT

S.No: RFI/MPTB1/RP42493B

Page 10 of 59

Issue Date: 31 October 2001

4. Deviations From The Test Specification

None.

5. Operation Of The EUT During Testing

5.1. Operating Conditions

The EUT was tested in a normal laboratory environment.

During testing, the EUT was powered by an internal 3.3 V DC battery supply.

5.2. Operating Modes

The EUT was tested in the following operating modes:

Transmitting on the following fixed frequencies: 2402, 2441 and 2480 MHz.

The reason for choosing these modes is that they are defined in the standard.

5.3. Configuration And Peripherals

The EUT was tested in the following configuration:

Please refer to the schematic diagram shown in Appendix 3 of this report.

NB Section 2 of this report contains a full list of support equipment used.

Test Of: Red-M (Communications) Ltd.

Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

6. Summary Of Test Results

6.1. Emissions: Transmit Mode

Range Of Measurements	Specification Reference	Compliance Status
Conducted AC Mains Emissions	C.F.R. 47 FCC Part 15: 2000. Section 15.207	Complied
Conducted Antenna Port Transmit Power	C.F.R. 47 FCC Part 15: 2000. Section 15.247 (b)	Complied
Conducted Peak Power Spectral Density	C.F.R. 47 FCC Part 15: 2000. Section 15.247 (d)	Complied
Conducted Antenna Port Spurious Emissions (30 to 26000 MHz)	C.F.R. 47 FCC Part 15: 2000. Section 15.247 (c)	Complied
Modulation Requirements / Channel Spacing / Timing Requirements	C.F.R. 47 FCC Part 15: 2000. Section 15.247 (a)	Complied
Isotropic Effective Radiated Power (EIRP)	C.F.R. 47 FCC Part 15: 2000. Section 15.247 (b) (1)	Complied
Radiated Electric Field Strength Spurious Emissions (30 to 26000 MHz)	C.F.R. 47 FCC Part 15: 2000. Section 15.247 (c) (15.209)	Complied

6.2. Emissions: Receive Mode

Range Of Measurements	Specification Reference	Compliance Status
Conducted AC Mains Emissions	C.F.R. 47 FCC Part 15: 2000. Section 15.107	Complied
Radiated Electric Field Strength Spurious Emissions (30 to 26000 MHz)	C.F.R. 47 FCC Part 15: 2000. Section 15.109	Complied

6.3. Location Of Tests

All the measurements described in this report were performed at the premises of Radio Frequency Investigation Ltd, Ewhurst Park, Ramsdell, Basingstoke, Hampshire, RG26 5RQ, England.

**Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor**

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

7. Measurements, Examinations And Derived Results

7.1. General Comments

7.1.1. This section contains test results only. Details of the test methods and procedures can be found in Appendix 2 of this report.

7.1.2. Measurement uncertainties are evaluated in accordance with current best practice. Our reported expanded uncertainties are based on standard uncertainties, which are multiplied by an appropriate coverage factor to provide a statistical confidence level of approximately 95%. Please refer to Section 8 for details of measurement uncertainties.

7.1.3. Band edge compliance of RF conducted emissions was performed on the top and bottom channels as specified in FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

7.2. Test Results For AC Mains Conducted Emissions: Transmit Mode

7.2.1. Quasi-Peak Detector Measurements On Live And Neutral Lines

7.2.1.1. The following table indicates measured results to the limits specified in Part 15.207 (a) and (b)

7.2.1.2. Preliminary Conducted spurious scans were performed with the EUT set to Top, Middle and Bottom channels stated in section 5.2.

7.2.1.3. Plots of all the initial scans can be found in Appendix 4.

7.2.1.4. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector:

Bottom Channel

Frequency (MHz)	Line	Q-P Level (dBmV)	Q-P Limit (dBmV)	Margin (dB)	Result
0.753	Live	38.6	48.0	9.4	Complied
3.974	Live	32.1	48.0	15.9	Complied
5.049	Live	40.5	48.0	7.5	Complied
5.487	Live	40.4	48.0	7.6	Complied
26.488	Live	38.4	48.0	9.6	Complied
0.753	Neutral	34.0	48.0	14.0	Complied
3.974	Neutral	32.7	48.0	15.3	Complied
5.049	Neutral	40.7	48.0	7.3	Complied
5.487	Neutral	40.4	48.0	7.6	Complied
26.488	Neutral	39.0	48.0	9.0	Complied

Test Of: Red-M (Communications) Ltd.

7.3. Test Results For AC Mains Conducted Emissions: Receive Mode

7.3.1. Quasi-Peak Detector Measurements On Live And Neutral Lines

7.3.1.1. The following table indicates measured results to the limits specified in Part 15.207.

7.3.1.2. Plots of the initial scans can be found in Appendix 4.

7.3.1.3. The following table lists frequencies at which emissions were measured using a Quasi-Peak detector:

Frequency (MHz)	Line	Q-P Level (dB _{mV})	Q-P Limit (dB _{mV})	Margin (dB)	Result
0.753	Live	38.6	48.0	9.4	Complied
3.974	Live	32.1	48.0	15.9	Complied
5.049	Live	40.5	48.0	7.5	Complied
5.487	Live	40.4	48.0	7.6	Complied
26.488	Live	38.4	48.0	9.6	Complied
0.753	Neutral	34.0	48.0	14.0	Complied
3.974	Neutral	32.7	48.0	15.3	Complied
5.049	Neutral	40.7	48.0	7.3	Complied
5.487	Neutral	40.4	48.0	7.6	Complied
26.488	Neutral	39.0	48.0	9.0	Complied

**Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor**

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

7.4. Test Results for Conducted Transmitter Power: Transmit Mode

7.4.1. Tests were performed to identify the maximum transmit power in accordance with FCC Part 15.247(b)(1) and FCC Public Notice DA 00-705.

7.4.2. The client has provided a temporary antenna port to allow a direct connection to be made.

7.4.3. The client has specified that the EUT employs frequency hopping with 79 hopping channels. Therefore the maximum transmitter power level under FCC Part 15.247(b)(1) is 1 Watt.

7.4.4. It can be confirmed from Plot GPH/42493/03 to GPH/42493/05 Appendix 4 that the number of hopping channels employed by the EUT was 79.

7.4.5. Results are shown for the EUT set to Top, Middle and Bottom channels as stated in FCC Part 15.31 (m) and section 5.2 of this report. Graphical measurements are shown for the transmit power levels within GPH/42493/08 to GPH/42493/10.

7.4.6. Measurements were performed on the Top, Middle and Bottom channels using a fully charged battery as specified in FCC Part 15.31(e) for battery operated devices:

Test Of: Red-M (Communications) Ltd.

7.6. Peak Power Spectral Density For Direct Sequence Systems

The EUT employs less than 75 channels in the acquisition mode, as such, the device must be classified as a hybrid system FCC Part 15.247(f), and must also comply with the requirements for direct sequence systems. Tests were performed to identify the maximum transmit peak power spectral density in accordance with FCC Part 15.247(d).

7.6.1. The client has provided a temporary antenna port to allow a direct connection to be made.

7.6.2. Testing was performed on the Bottom, Middle and Top channels used for the accusation mode. Spectral power density in the 3 kHz bandwidth was then measured as specified in FCC Part 15.247(d).

Channel	Battery Input Voltage (DC)	Maximum Transmitter Output Level (dBm/3kHz)	Limit (dBm/3kHz)	Margin	Result
Bottom	3.6	-14.4	8.0	22.4	Complied

Channel	Battery Input Voltage (DC)	Maximum Transmitter Output Level (dBm/3kHz)	Limit (dBm/3kHz)	Margin	Result
Middle	3.6	-12.8	8.0	20.8	Complied

Channel	Battery Input Voltage (DC)	Maximum Transmitter Output Level (dBm/3kHz)	Limit (dBm/3kHz)	Margin	Result
Top	3.6	-14.3	8.0	22.3	Complied

7.7.Band Edge Compliance of RF Conducted Emissions FCC 15.247(c)

7.7.1.The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

7.7.2.A temporary antenna port was provided by the applicant to allow for conducted measurements.

7.7.3.To determine band-edge compliance, the analyser bandwidth resolution bandwidth was set to $\approx 1\%$ of the analyser span. The video bandwidth was set to be no less than the resolution bandwidth. The sweep was set to auto and the detector to peak. The trace was set to max hold and a trace was produced.

7.7.4.A plot of the upper channel and the protected band closest to the upper channel was produced. A marker was set to the peak of the highest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission, whichever is greater). The plots show that the emission complies with the 20 dBc limit.

7.7.5.A plot of the lower channel and the protected band closest to the lower channel was produced. A marker was set to the peak of the lowest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission, whichever is greater). The plots show that the emission complies with the 20 dBc limit.

7.7.6.The above procedure was then repeated with the EUT set to its hopping mode.

7.7.7.Four graphs in total were produced, two with the device set to top and bottom channels and two with the device set to its hopping mode.

7.8. Test Results For Band Edge Radiated Emissions

7.8.1. Electric Field Strength Measurements

7.8.1.1. The EUT and spectrum analyser were configured for radiated measurements as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

7.8.1.2. A plot of the protected band closest to the upper channel was produced with frequency hopping mode turned off and the device set to transmit on the top channel. A marker was set to the peak of the highest out of band emission. (The specification states that either the band edge level must be measured or the highest out of band emission, which ever is greater).

7.8.1.3. The highest noted emission was then measured as per the requirements of FCC Part 15.209 for electric field strength measurements.

7.8.1.4. Frequency hopping was then turned on and the process repeated.

7.8.1.5. A plot of the protected band closest to the lower channel was then produced with frequency hopping turned off and the device set to transmit on the bottom channel. A marker was set to the peak of the highest out of band emission. (The specification states that either the band edge level must be measured or the highest out of band emission, which ever is greater).

7.8.1.6. The highest noted emission was then measured as per the requirements of FCC Part 15.209 for electric field strength measurements.

7.8.1.7. Frequency hopping was then turned on and the process repeated.

7.8.1.8. Four graphs were produced in total showing the responses in the limited frequency bands. The plots can be seen in appendix 1 of this report.

7.9. Test Results for Conducted Antenna Port Spurious Emissions: Transmit Mode.

7.9.1. Spurious emissions tests on the antenna port were performed in accordance with FCC Part 15.247(c).

7.9.2. Section 15.247(c) specifies that all spurious emissions should be attenuated at least 20 dB below the level of the highest fundamental level measured between the range of 2400 to 2483.5 MHz.

7.9.3. Scans were performed between 30 and 26000 MHz with the EUT operating in Top, Middle and Bottom channels, as specified within clause 15.31 (m).

7.9.4. Spurious emissions that were of an amplitude of less than 20 dB below the reference level were recorded in the following tables.

7.9.5. Spurious emissions that were of an amplitude of greater 20 dB below the reference limit line were not recorded as per FCC Part 15.21(o).

7.9.6. Plots of all the initial scans can be found in Appendix 4.

Bottom Channel

Frequency (MHz)	Level (dBm))	Limit (dBm)	Margin	Result
1.200266	-37.23	-25.53	11.7	Complied

Note 1: Due to the presence of an ambient signal this emission was re-measured using a substitution method. At the emission frequency a high level signal was generated in the screened room used for the initial swept measurements. This measurement was then repeated on the open area test site. The difference in amplitude between the screened room measurement and free-field measurement was then used to correct the value obtained in the screened room for the test sample.

7.15. Test Results for Occupied Bandwidth, Channel Separation and Time Occupancy.

7.15.1. Tests were performed to identify the Occupied Bandwidth, Channel Separation and Time Occupancy to FCC Part 15.247.

Occupied Bandwidth and Channel Separation:

7.15.2. Section 15.247 (a)(1) specifies that the channels should be separated by at least 25 kHz or the 20 dB bandwidth of the channel, which ever is greater. Section 15.247 (a1)(ii) specifies that the maximum bandwidth of the channel should be 1 MHz.

7.15.3. A graphical plot of the characteristics of two adjacent channels was performed. The following results were noted:

20 dB Bandwidth: 877.756 kHz. (Refer to Appendix 4 Plot GPH/42493/02)

Channel Separation: 1000.000 kHz. (Refer to Appendix 4 Plot GPH/42493/01)

Time Occupancy:

7.15.4. The time occupancy of the system was tested on a single carrier. The maximum packet length was measured to be 2.887 ms and can be seen in Appendix 4 (Plot GPH/42493/07). The maximum time the carrier was used in a 30 second period was measured as 0.312 seconds and can be seen by the number of transmissions in Appendix 4 (Plot GPH/42493/06) times by the maximum packet length.

8. Measurement Uncertainty

8.1. No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

8.2. The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

8.3. The uncertainty of the result may need to be taken into account when interpreting the measurement results.

8.4. The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Measurement Type	Range	Confidence Level (%)	Calculated Uncertainty
Conducted Emissions	0.15 MHz to 30 MHz	95%	+/- 3.25 dB
Time Occupancy	Not applicable	95%	+/- 10 %
Channel Separation	Not applicable	95%	+/- 10 %
Occupied Bandwidth	Not applicable	95%	+/- 2.5 kHz
Conducted Power	30 MHz to 1000 MHz	95%	+/- 0.6 dB
Effective Isotropic Radiated Power	1.0 GHz to 26 GHz	95%	+/- 4.0 dB
Radiated Emissions at 3.0 metres	30 MHz to 1000 MHz	95%	+/- 5.26 dB
Radiated Emissions at 3.0 metres	1 GHz to 26 GHz	95%	+/- 4.18 dB

8.5. The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

Appendix 2. Measurement Methods

AC Mains Conducted Emissions

AC mains conducted emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

The test was performed in a shielded enclosure with the equipment arranged as detailed in the standard on a wooden bench using the floor of the screened enclosure as the ground reference plane and with the EUT powered via a 60 Hz AC mains supply.

Initial measurements in the form of swept scans covering the entire measurement band were performed in order to identify frequencies on which the EUT was generating interference. In order to minimise the time taken for these swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidths (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

Following the initial scans, a graph was produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested (at individual frequencies) using the appropriate detector function.

The test equipment settings for conducted emissions measurements were as follows:

Receiver Function	Initial Scan	Final Measurements
Detector Type:	Peak	Quasi-Peak (CISPR)*
Mode:	Max Hold	Not applicable
Bandwidth:	9 kHz	9 kHz
Amplitude Range:	100 dB	20 dB
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

* In some instances an Average detector function may also have been used.

Radiated Field Strength Emissions

Radiated emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

Initial measurements covering the entire measurement band in the form of swept scans in a shielded enclosure were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which the EUT should be re-measured in full on the open area test site. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

The initial scans were performed using an antenna height of 1.5 m and a measurement distance of 3 m, in some circumstances at high frequencies above 12 GHz, scans were performed at 30 cm's with a corrected limit line. This was necessary due to the limited dynamic range of the measuring receiver. Following the initial scans, graphs were produced giving an overview of the emissions from the EUT plotted against the appropriate specification limit. A tolerance line was set 6 dB below the specification limit and levels above the tolerance line were re-tested on the open area test site, at the appropriate distance, using a measuring receiver with a Quasi-Peak (below 1000 MHz), Average and Peak (above 1000 MHz) detector, where applicable.

For the main (final) measurements the EUT was arranged on a non-conducting table on an open area test site, as detailed in the specification.

All measurements on the open area test site were performed using broadband antennas.

On the open area test site, at each frequency where a signal was found, the levels were maximised by initially rotating the turntable through 360°. For frequencies below 1000 MHz, the antenna was varied in height between 1 m and 4 m. For frequencies above 1000 MHz, the antenna was fixed at a height of 1.5m. At this point, any signals found to be between the limit and a level 6 dB below it were further maximised by changing the configuration of the EUT, e.g. re-routing cables to peripherals and moving peripherals with respect to the EUT.

Test Of: Red-M (Communications) Ltd.

Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

The test equipment settings for radiated emissions measurements were as follows:

Receiver Function	Initial Scan Below 1000 MHz	Final Measurements Below 1000 MHz
Detector Type:	Peak	Quasi-Peak (CISPR)
Mode:	Max Hold	Not applicable
Bandwidth:	100 kHz	120 kHz
Amplitude Range:	100 dB	20 dB
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

Receiver Function	Initial Scan Above 1000 MHz	Final Measurements Above 1000 MHz
Detector Type:	Peak	Peak/Average
Mode:	Max Hold	Not applicable
Bandwidth:	1 MHz	1 MHz
Amplitude Range:	100 dB	20 dB (typical)
Measurement Time:	Not applicable	> 1 s
Observation Time:	Not applicable	> 15 s
Step Size:	Continuous sweep	Not applicable
Sweep Time:	Coupled	Not applicable

Conducted Antenna Port Emissions

Conducted Antenna Port Emissions measurements were performed in accordance with the standard, against appropriate limits for each detector function.

Prior to testing being performed a suitable RF attenuator and cable were calibrated for the required frequency range. For each measurement range performed, the calibrated level of the attenuator and cable were entered as an offset into the spectrum analyser to compensate for the measurement setup.

Initial measurements covering the entire measurement band in the form of swept scans were performed in order to identify frequencies on which the EUT was generating interference. This determined the frequencies on which measurements were performed. In order to minimise the time taken for the swept measurements, a Peak detector was used in conjunction with the appropriate detector IF measuring bandwidth (see table below). Repetitive scans were performed to allow for emissions with low repetition rates, and for the duty cycle of the EUT. The test configuration was the same for the initial scans as for the final measurements.

To determine the transmitter output power, the EUT was operated as intended with the spectrum analyser operated in a maximum hold on the bottom, middle and top channels of the EUT.

To determine spurious emissions levels, the EUT was operated as intended with the spectrum analyser operated in a maximum hold mode over selected frequency ranges between 30 MHz and 26 GHz. A reference limit line of 20dB below the maximum output of the transmitter was noted. Levels within 20dB of this limit line were then recorded.

**Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor**

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

Channel Separation FCC 15.247(1)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

To determine the bandwidth and separation of each transmission channel the analyser was configured to measure two adjacent channels.

To determine the occupied bandwidth, A resolution bandwidth of 10 kHz was used, which is greater than 1% of the 20 dB bandwidth. A video bandwidth of a least the same value was used. The analyser was set for a maximum hold scan to capture the profile of the signal. The peak level was then determined, and a reference line was drawn 20dB below the peak level. The bandwidth was determined at the points where the 20dB reference crossed the profile of the emission.

Occupied Bandwidth FCC 15.247(1)

For channel separation, the analyser was configured with a resolution bandwidth and video bandwidth of at least 1% of the frequency span set on the analyser. A setting of 50 kHz was used.

The EUT was operated as intended and the analyser set to a maximum hold mode scan to capture the profile of the signals.

The peak points on the two adjacent channels were noted and the separation between them recorded.

The channel separation was then determined as the greater of 25kHz or the 20dB bandwidth.

**Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor**

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

Average Time of Occupancy FCC 15.247(1)(ii)

The EUT and spectrum analyser was configured as for conducted antenna port measurements

To determine the maximum packet length on any given channel, the analyser was configured in the time domain mode and the EUT was configured to operate as intended.

To determine the average occupancy time on any given channel the analyser was configured in the time domain and a 30 second sweep carried out. The number of times the channel was occupied in any 30 second period multiplied by the maximum packet length will give the total time on the given channel.

Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

Number Of Hopping Frequencies FCC 15.247(a)(1)(ii)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

To determine the number of hopping frequencies the EUT was set to operate in its normal mode of operation, hopping over all channels that it is intended to operate on.

The spectrum analyser had a span set to cover the frequency band of operation. The resolution bandwidth was set to $\geq 1\%$ of the span. The video bandwidth was set to be no less than the resolution bandwidth. The sweep was set to auto, the detector function to peak and trace to max hold.

**Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor**

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

Peak Output Power FCC 15.247(b)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

A temporary antenna port was provided by the applicant to allow for conducted measurements.

As the frequency range of operation was greater than 10 MHz, The test was performed on the BOTTOM, MIDDLE and TOP channels as per FCC 15.31(m).

The tests were performed with a fully charged battery as specified in FCC Part 15.31(e) for battery operated devices:

The analyser was setup as per FCC Public Notice DA 00-705.

Test Of: Red-M (Communications) Ltd.
Bluetooth Module for Visor

To: F.C.C. Part 15 Subpart C: 1998 (Intentional Radiators) Section 15.247

Peak Power Spectral Density For Direct Sequence Systems FCC Part 15.247(d)..

The EUT and spectrum analyser was configured as for conducted antenna port measurements.

A temporary antenna port was provided by the applicant to allow for conducted measurements.

As the frequency range of operation was greater than 10 MHz, The test was performed on the BOTTOM, MIDDLE and TOP channels as per FCC 15.31(m).

The tests were performed with a fully charged battery as specified in FCC Part 15.31(e) for battery operated devices:

Testing was performed on the Bottom, Middle and Top channels used for the accusation mode. Spectral power density in the 3 kHz bandwidth was then measured as specified in FCC Part 15.247(d).

Band Edge Compliance of RF Conducted Emissions FCC 15.247(c)

The EUT and spectrum analyser was configured as for conducted antenna port measurements, And as per FCC Public Notice DA 00-705, Filing and Measurement Guidelines for Frequency Hopping Spread Spectrum Systems.

A temporary antenna port was provided by the applicant to allow for conducted measurements.

To determine band-edge compliance, the analyser bandwidth resolution bandwidth was set to $\geq 1\%$ of the analyser span. The video bandwidth was set to be no less than the resolution bandwidth. The sweep was set to auto and the detector to peak. The trace was set to max hold and a trace was produced.

A Plot of the upper channel and the protected band closest to the upper channel was produced. A marker was set to the peak of the highest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission. Which ever is greater). The plots show that the emission complies with the 20 dBc limit.

A Plot of the lower channel and the protected band closest to the lower channel was produced. A marker was set to the peak of the lowest channel and a delta marker set to the highest out of band peak. (The specification states that either the band edge level must be measured or the highest out of band emission. Which ever is greater). The plots show that the emission complies with the 20 dBc limit.

Appendix 3. Test Configuration Drawings

This appendix contains the following drawings:

Drawing Reference Number	Title
DRG\42493JD02\EMICON	Test configuration for measurement of conducted emissions
DRG\42493JD02\EMIRAD	Test configuration for measurement of radiated emissions
DRG\42493JD02\001	Test configuration for Conducted RF Antenna Port
DRG\42493JD02\002	Schematic diagram of the EUT, support equipment and interconnecting cables used for the test
