Chapter 1 Introduction

Description of EUT

This device is the modem of ADSL interface. The EUT is designed to install in the personal computer, It is a data transmission / receiving facility and makes your data equipment available to transmit / receive data via the EUT.

Connections of EUT

- (1)Install the EUT into a personal computer's PCI interface and screw it.
- (2)The Line jack is connected with a line cable to the ADSL evaluation module, which located remotely.
- (3)The Phone jack is connected with a telephone set.

Test method

The applicant provides the testing program.

Pretest was found that the emission of operating mode is worse than standby mode. So, The final test is made at the operating mode.

When the measurement was taken, the EUT was operated at "transmitting" and "receiving" mode simultaneously. While testing, the transmitting rate was set to "AUTO" which means it transmitted the test file depending on the telephone line condition, normally the operating rate is the highest speed.

The test placement as the photographs showed is the worst case emission placed. (If the emission is close to the ambient, the resolution BW and view resolution will be reduced and the data will be recorded by detection of maximum hold peak mode.)

The testing configuration of test setup is showing in the next page.

Configuration of Test Setup

Connections of Support Equipment

PC:

- *Serial port --- an external modem
 - *Printer port --- a printer
 - *Monitor port --- a monitor
 - *Keyboard port --- a keyboard
 - *Mouse port --- a mouse
 - *USB A port --- a USB mouse
 - *USB B port --- a USB joystick
- (Each port on PC is connected with suitable device)

Connections of EUT

ADSL Modem:

- *Line jack
 - 15m long, non-shielded, no ferrite bead, RJ-11 cable
- *Phone jack
 - 7feet long, non-shielded, no ferrite core, RJ-11 cable

Serial No. : 006060

Power type : Switching Adaptor

Power cord : Shielded. 2.1m long, No ferrite bead

Chapter 2 Conducted Emission Test

Test condition and setup

All the equipment is placed and setup according to the ANSI C63.4 - 1992.

The EUT is assembled on a wooden table, which is 80 cm high, is placed 40 cm from the back-wall, which is a vertical conducting plane. One LISN is for EUT, the other LISN is for support equipment. They are all placed on the conductive ground. The EUT's LISN connect a line switch box for selecting L1 or L2, then connect to a preamplifier and spectrum.

The spectrum scans from 450KHz to 30 MHz. Conducted emission levels are detected at maximum peak mode. But if the maximum peak mode failed, it will be measured by CISPR's quasi-peak detection mode.

While testing, there is the worst-emission plot printed at peak detection mode, and there are more than 6 highest emissions relative to limit recorded. The plot is kept as the original data, not included in test report.

Chapter 3 Radiated Emission Test

Test condition and setup

Pretest: Prior to the final test (OATS test), the EUT is placed in a shielded enclosure, and scan from 30MHz to 1GHz. This is done to ensure the radiation is exactly emitted from the EUT.

Final test: Final radiation measurements are made on a **3 – meter**, open-field test site. The EUT is placed on a nonconductive table, which is 0.8m height, the top surface is 1.0 x 1.5 meter. The entire placement is according to ANSI C63.4 - 1992.

The spectrum is examined from 30 MHz to 1000 MHz measured by HP spectrum.

The range Antenna is used to measure frequency from 30 MHz to 1GHz. The final test is used the spectrum analyzer.

Measure more than six top marked frequencies generated from pretest by computer step by step at each frequency. The EUT is rotated 360 degrees, and antenna is raised and lowered from 1 to 4 meters to find the maximum emission levels. The antenna is used with both horizontal and vertical polarization.

Appropriated preamplifier which is made by TRC is used for improving sensitivity and precautions is taken to avoid overloading. The spectrum analyzer's 6dB bandwidth is set to 120 kHz, and the EUT is measured at quasi-peak mode.

If the emission is close to the frequency band of ambient, the tester will recheck the data and the corrected data will be written in the test data sheet. If the emission is just within the ambient, the data from shielded room will be taken as the final data.

1. Margin = Amplitude - limit, *if margin is minus means under limit.*
2. Corrected Amplitude = Reading Amplitude + Correction Factors
3. Correction factor = Antenna factor + (Cable Loss – Amplitude gain)
 (For example: 30MHz correction factor = 15.5 + (–15.26) = 0.24 dB/m)
