TEST PROCEDURE

GENERAL:

A test program was run which simulated a normal transmission.

BANDWIDTH 20dB:

The measurements were made with the spectrum analyzer's resolution bandwidth (RBW)=100KHz and the video bandwidth (VBW)=1.0MHz and the span set as shown on the plot.

POWER OUTPUT:

The radiated output power was measured, with the spectrum analyzer and Bilog Antenna, in the test mode which simulated normal operation.

RADIATION INTERFERENCE:

The test procedure used was ANSI STANDARD C63.4-1992 using an appropriate spectrum analyzer, as listed in the Test Equipment List. The bandwidth (RBW) of the spectrum analyzer was 100KHz/120KHz up to 1GHz with an appropriate sweep speed. The RBW above 1.0GHz was = 1MHz. The analyzer was calibrated in dB above a microvolt at the output of the antenna. The ambient temperature of the UUT was 24°F with a humidity of 60%. The UUT was tested from 30MHz to 3.5GHz.

BANDWIDTH

The 20dB bandwidth is 408KHz (refer to D(1)-6) which is less than the limit
(.25% of 315MHz = 787.5KHz).

Emissions radiated outside of the specified frequency bands, except for harmonics, shall be attenuated by at least 50dB below the level of the fundamental or to the general radiated emission limits in 15.209, whichever is the lesser attenuation.

Emissions that fall in the restricted bands (15.205) must be less than 54dB μ V/m

15.231(e)

The Model 40060 operates at nominally 315 MHz.

CARRIER

The limit for the carrier is given according to the formula:

$$\begin{array}{lcl} \text{F S } (\mu\text{V/M}) & = & 16.67 \times \text{F} - 2833.33 \\ \text{(Field Strength)} & & \end{array}$$

$$\text{The limit for the 40060} = 16.67 \times 315 - 2833.33 = 2417.72 \mu\text{V/M} \text{ or } 67.67 \text{ dB}\mu\text{V/M}.$$

UNWANTED EMISSIONS

The limit for unwanted emissions is 1/10 of the maximum carrier field strength or $241.77 \mu\text{V/M}$ which converts to $47.7 \text{ dB}\mu\text{V/M}$. Unwanted emissions above 960 MHz may use the general limit of $54 \text{ dB}\mu\text{V/M}$. [15.231(b)(3)]

15.231(e) AUTOMATIC TRANSMISSION LIMITATION

(refer to Modulation & Coding [Exhibit D(1)-9])

The re-transmission rate is $11 + X$ seconds where X is less than 6. The silent period is therefore greater than $30 \times .253 \text{ S} = 7.6$ seconds and is always longer than the 10 seconds minimum.

15.231(b)(2); 15.35(c)

PEAK TO AVERAGE RATIO (refer to Modulation & Coding [Exhibit D(1)-9])

The total on time is 253.211 mSeconds which is less than the 1 Second period allowed.

The pulse on time vs pulse off time is nominally 50% or 0.5.

The peak to average ratio is therefore $20 \log 0.5 = -6 \text{ dB}$

15.231(d)

New batteries were used for the measurements.
