

EMC - TEST REPORT

UNITED STATES STANDARD FCC PART 95

Test Report File No. : SC602042-08 Date of Issue: 18 April 2006

Model / Serial No. : 9400-02 / --

Product Type : STS Transmitter

Applicant : DEXCOM INCORPORATED

Manufacturer : DEXCOM INCORPORATED

License holder : DEXCOM INCORPORATED

Address : 5555 Oberlin Drive
: San Diego, CA 92121

Test Result : ☒ **Positive** ☐ **Negative**

Test Project Number
Reference(s) : SC602042-08

Total pages - Test Report : 30

NOTE: All test equipment used during testing is calibrated and traceable to NIST.

TÜV America reports apply only to the specific sample tested under stated test conditions. It is the manufacturer's responsibility to assure the continued compliance of production units of this model. TÜV America, Inc. shall have no liability for any deductions, inferences or generalizations drawn by the client or others from TÜV America, Inc. issued reports.

This report is the confidential property of the client. As a mutual protection to our clients, the public and ourselves, extracts from the test report shall not be reproduced except in full without our written approval. This report shall not be used by the client to claim product endorsement by NVLAP or any agency of the US government.

TÜV America, Inc. and its professional staff hold government and professional organization certifications and are members of AAMI, ACIL, AEA, ANSI, IEEE, NVLAP, and VCCI

3115	6669	Double Ridge Antenna	EMCO	9412-4364	08/05
CBL 6111	6527	Bilog Antenna	Chase Electronics	--	08/05

Remarks: One year calibration cycle for all test equipment and sites.

Equipment Under Test (EUT) Test Operation Mode:

The equipment under test was operated under the following conditions during testing:

- ☐ - Standby
- ☐ - Test Program (H - Pattern)
- ☐ - Test Program (Color Bar)
- ☐ - Test Program (Customer Specified)
- ☐ - Practice Operation
- ☒ - Normal Operating Mode

☐ - _____

Configuration of the equipment under test:

- ☐ - See Constructional Data Form in Appendix B
- ☒ - See Product Information Form(s) in Appendix B

The following peripheral devices and interface cables were connected during the testing:

- | | |
|---|-----------------|
| ☐ - _____ | Type: _____ |
| ☐ - _____ | Type: _____ |
| ☐ - _____ | Type: _____ |
| ☐ - _____ | Type: _____ |
| ☐ - _____ | Type: _____ |
| ☐ - _____ | Type: _____ |
| ☐ - Unshielded power cable | |
| ☐ - Unshielded cables | |
| ☐ - Shielded cables | MPS. No.: _____ |
| ☐ - Customer specific cables | |
| ☐ - _____ | |
| ☐ - _____ | |

GENERAL REMARKS:

NOTE: All photographs are representative of setup for maximum emissions.

SUMMARY:

All tests according to the regulations cited on page 3 were

■ - **Performed**

□ - Performed with the following **exceptions**

The Equipment Under Test

■ - **Fulfills** the general approval requirements cited on page 3.

□ - **Does not** fulfill the general approval requirements cited on page 3.

Statement of Measurement Uncertainty

The data and results referenced in this document are true and accurate. The measurement uncertainty is calculated to be ± 2 dB for conducted emissions and ± 4 dB for radiated emissions.

Equipment Received Date:	<u>10 April 2006</u>
Testing Start Date:	<u>10 April 2006</u>
Testing End Date:	<u>17 April 2006</u>

Test Setup for Frequency Stability

Frequency Stability (Variation of Ambient Temperature)

* Could place EUT or the frequency determining part of the EUT inside temperature chamber. The frequency determining part of the EUT is what controls the accuracy of the transmitted frequency.

Frequency stability (variation of supply voltage)

FREQUENCY STABILITY

Procedure

2.1055 Measurements required: Frequency stability.

(a) The frequency stability shall be measured with variation of ambient temperature as follows:

(1) From -30°C to $+50^{\circ}\text{C}$ centigrade for all equipment except that specified in paragraphs (a) (2) and (3) of this section.

(2) From -20°C to $+50^{\circ}\text{C}$ centigrade for equipment to be licensed for use in the Maritime Services under part 80 of this chapter, except for Class A, B, and S Emergency Position Indicating Radio beacons (EPIRBs), and equipment to be licensed for use above 952 MHz at operational fixed stations in all services, stations in the Local Television Transmission Service and Point-to-Point Microwave Radio Service under part 21 of this chapter, and equipment licensed for use aboard aircraft in the Aviation Services under part 87 of this chapter.

(3) From 0°C to $+50^{\circ}\text{C}$ centigrade for equipment to be licensed for use in the Radio Broadcast Services under part 73 of this chapter.

(b) Frequency measurements shall be made at the extremes of the specified temperature range and at intervals of not more than 10°C centigrade through the range. A period of time sufficient to stabilize all of the components of the oscillator circuit at each temperature level shall be allowed prior to frequency measurement. The short term transient effects on the frequency of the transmitter due to keying (except for broadcast transmitters) and any heating element cycling normally occurring at each ambient temperature level also shall be shown. Only the portion or portions of the transmitter containing the frequency determining and stabilizing circuitry need be subjected to the temperature variation test.

(c) In addition to all other requirements of this section, the following information is required for equipment incorporating heater type crystal oscillators to be used in mobile stations, for which type acceptance is first requested after March 25, 1974, except for battery powered, hand carried, portable equipment having less than 3 watts mean output power.

(1) Measurement data showing variation in transmitter output frequency from a cold start and the elapsed time necessary for the frequency to stabilize within the applicable tolerance. Tests shall be made after temperature stabilization at each of the ambient temperature levels; the lower temperature limit, 0°C centigrade and $+30^{\circ}\text{C}$ centigrade with no primary power applied.

(2) Beginning at each temperature level specified in paragraph (c)(1) of this section, the frequency shall be measured within one minute after application of primary power to the transmitter and at intervals of no more than one minute thereafter until ten minutes have elapsed or until sufficient measurements are obtained to indicate clearly that the frequency has stabilized within the applicable tolerance, whichever time period is greater. During each test, the ambient temperature shall not be allowed to rise more than 10°C centigrade above the respective beginning ambient temperature level.

(3) The elapsed time necessary for the frequency to stabilize within the applicable tolerance from each beginning ambient temperature level as determined from the tests specified in this paragraph shall be specified in the instruction book for the transmitter furnished to the user.

(4) When it is impracticable to subject the complete transmitter to this test because of its physical dimensions or power rating, only its frequency determining and stabilizing portions need be tested.

FREQUENCY STABILITY (continued)

Procedure

(d) The frequency stability shall be measured with variation of primary supply voltage as follows:

(1) Vary primary supply voltage from 85 to 115 percent of the nominal value for other than hand carried battery equipment.

(2) For hand carried, battery powered equipment, reduce primary supply voltage to the battery operating end point which shall be specified by the manufacturer.

(3) The supply voltage shall be measured at the input to the cable normally provided with the equipment, or at the power supply terminals if cables are not normally provided. Effects on frequency of transmitter keying (except for broadcast transmitters) and any heating element cycling at the nominal supply voltage and at each extreme also shall be shown.

(e) When deemed necessary, the Commission may require tests of frequency stability under conditions in addition to those specifically set out in paragraphs (a), (b), (c), and (d) of this section.

(For example measurements showing the effect of proximity to large metal objects, or of various types of antennas, may be required for portable equipment.)

Part 95, Paragraph 95.628(e)

Each transmitter in the MICS service must maintain a frequency stability of ± 100 ppm of the operating frequency over the range:

25° C to 45° C in the case of medical implant transmitters and 0° C to 55° C in the case of medical implant programmer/control transmitters.

Test Setup for Emission Bandwidth

EMISSION BANDWIDTH

Procedure

20 dB Bandwidth

Use the following spectrum analyzer settings:

Span = approximately 2 to 3 times the 20 dB bandwidth, centered on a hopping channel

RBW $\square$ 1% of the 20 dB bandwidth

VBW $\square$ RBW

Sweep = auto

Detector function = peak

Trace = max hold

The EUT should be transmitting at its maximum data rate. Allow the trace to stabilize. Use the marker-to-peak function to set the marker to the peak of the emission. Use the marker-delta function to measure 20 dB down one side of the emission. Reset the marker-delta function, and move the marker to the other side of the emission, until it is (as close as possible to) even with the reference marker level. The marker-delta reading at this point is the 20 dB bandwidth of the emission. If this value varies with different modes of operation (e.g., data rate, modulation format, etc.), repeat this test for each variation. The limit is specified in one of the subparagraphs of this section. Submit this plot(s).

Part 95, Paragraph 95.633(e)

For transmitters in the MICS, the maximum authorized emission bandwidth is 300 kHz.

Test Setup for Maximum Transmitter Power

OUTPUT POWER

Part 95, Paragraph 95.639 - Maximum Transmitter Power.

In the MICS the following limits apply:

- (1) The maximum EIRP for MICS transmitter stations is 25 microwatts. (Note: The antenna associated with any MICS transmitter must be supplied with the transmitter and shall be considered part of the transmitter subject to equipment authorization.)
- (2) Compliance of MICS transmitters with the 25 microwatts EIRP limit is determined by measuring the radiated field from the EUT at 3 meters and calculating the EIRP. The equivalent radiated field strength at 3 meters for 25 microwatts EIRP is 18.2 mV/meter when measured on an open area test site, or 9.1 mV/meter when measured on a test site equivalent to free space such as a fully anechoic test chamber. For both, compliance is based on measurements using a peak detector function and measured over an interval of time when transmission is continuous and at its maximum power level. In lieu of using a peak detector function, instrumentation techniques set forth in ANSI C63.17-1998, Section 6.1.2.2.1 or Section 6.1.2.2.2 may be used in determining compliance with the above specifications.
- (3) The power radiated in any 300 kHz bandwidth shall not exceed 25 microwatts EIRP. See §§95.633(e) and 95.639(g).
