3 EUT description

3.1 General description

An indoor radio adapter, IDR 900 MHz, is a part of a WipLL broadband fixed cellular wireless access system. The system provides a radio link between an end-user (a subscriber) and a network itself to give high-speed data access. The EUT is a hybrid system transceiver (8FSK digital modulation with frequency hopping, data rate 3 Mbps and 4 Mbps), operating in 903 MHz to 927 MHz range and powered by mains. The IDR is installed inside the subscriber's premises, typically mounted on a wall, desktop, or pole. The IDR is connected to a third-party 6.5 dBi or 10 dBi gain external antenna, which is typically mounted outside to provide line-of-sight with the base station.

3.2 EUT test configuration

Throughout testing the communication link with BSR base station unit was established. The EUT operating frequencies generated by clocks and oscillators: 350 MHz - first IF, 6 MHz – second IF. The WipLL system architecture is shown in Figure 3.2.1, the EUT configuration with PC – in Figure 3.2.2, the test/support equipment is given in Table 3.2.1.
