ADMINISTRATIVE INFORMATION

DATE OF TEST: April 2-4, 2003

DATE OF RECEIPT: April 3, 2003

PURPOSE OF TEST: To demonstrate the compliance of the
ADVANTAG 9100 with the requirements for FCC
Part 15 Subpart C Sections 15.207 & 15.209
devices.

TEST METHOD: ANSI C63.4 (1992)

MANUFACTURER: Asyst Technologies
48761 Kato Road
Fremont, CA 94538

REPRESENTATIVE: Saeed Taghipour

TEST LOCATION: CKC Laboratories, Inc.
5473A Clouds Rest
Mariposa, CA 95338

SUMMARY OF RESULTS

As received, the Asyst Technologies ADVANTAG 9100 was found to be fully compliant with the following standards and specifications:

United States

- FCC Part 15 Subpart C Sections 15.207 & 15.209
- ANSI C63.4 (1992) method

CONDITIONS FOR COMPLIANCE

No modifications to the EUT were necessary to comply.

APPROVALS

QUALITY ASSURANCE:

A handwritten signature in black ink that reads "Steve Behm".

Steve Behm, Director of Engineering Services
and Quality Assurance

A handwritten signature in black ink that reads "Joyce Walker".

Joyce Walker, Quality Assurance Administrative
Manager

A handwritten signature in black ink that reads "Mike Wilkinson".

Mike Wilkinson, Lab Manager

TEST PERSONNEL:

A handwritten signature in black ink that reads "Randy Clark".

Randy Clark, EMC Engineer

15.31(e) Voltage Variations

Voltage Variation on Peak Power				
FREQUENCY kHz	CORRECTED READING dBμV/m 85%	CORRECTED READING dBμV/m 100%	CORRECTED READING dBμV/m 115%	SPEC LIMIT dBμV/m
134.205	12.5	12.6	12.5	25.0

Test ANSI C63.4 (1992)
 Method:
 Spec FCC Part 15 Subpart C Section
 Limit: 15.209/15.31(e)
 Test 10 meters
 Distance:

15.31(m) Number Of Channels

This device operates on a single channel.

15.33(a) Frequency Ranges Tested

15.207 Conducted: 150 kHz – 30 MHz

15.209 Radiated: 9 kHz – 1000 MHz

FCC SECTION 15.35: ANALYZER BANDWIDTH SETTINGS PER FREQUENCY RANGE			
TEST	BEGINNING FREQUENCY	ENDING FREQUENCY	BANDWIDTH SETTING
CONDUCTED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	9 kHz	150 kHz	200 Hz
RADIATED EMISSIONS	150 kHz	30 MHz	9 kHz
RADIATED EMISSIONS	30 MHz	1000 MHz	120 kHz

15.203 Antenna Requirements

The antenna is removable and does not employ a unique connector, however the device is professionally installed and maintained. Therefore, the EUT complies with 15.203. For more information, refer to the installation/user's manual.

15.205 Restricted Bands

The fundamental operating frequency lies outside the restricted bands and therefore complies with the requirements of Section 15.205 of the FCC rules. Any spurious emission coming from the EUT was investigated to determine if any portion lies inside the restricted band. If any portion of a spurious emissions signal was found to be within a restricted band, investigation was performed to ensure compliance with Section 15.209.

Eut Operating Frequency

The EUT was operating at 134.2 kHz.

Temperature And Humidity During Testing

The temperature during testing was within +15°C and + 35°C.

The relative humidity was between 20% and 75%.

EQUIPMENT UNDER TEST (EUT) DESCRIPTION

The EUT tested by CKC Laboratories was a production unit.

The following model was tested by CKC Laboratories:

RFID Reader, ATR-9100

Since the time of testing the manufacturer has chosen to use the following model name in its place. Any differences between the names does not affect their EMC characteristics and therefore complies to the level of testing equivalent to the tested model name shown on the data sheets:

ADVANTAG 9100**EQUIPMENT UNDER TEST****RFID Reader**

Manuf: Asyst Technologies

Model: ADVANTAG 9100

Serial: C1

FCC ID: pending

PERIPHERAL DEVICES

The EUT was tested with the following peripheral device(s):

Power Supply

Manuf: Sola

Model: SLS-24-012T

Serial: 8869 0150

FCC ID: NA

REPORT OF MEASUREMENTS

The following tables report the worst case emissions levels recorded during the tests performed on the EUT. All readings taken were peak readings unless otherwise stated. The data sheets from which the emissions tables were compiled are contained in Appendix C.

Table 1: 15.207 Six Highest Conducted Emission Levels									
FREQUENCY MHz	METER READING dBμV	CORRECTION FACTORS				CORRECTED READING dBμV	SPEC LIMIT dBμV	MARGIN dB	NOTES
		Lis n dB		Cabl e dB					
0.150000	50.1	0.2		0.1		50.4	56.0	-5.6	W
17.309170	43.9	0.5		0.2		44.6	50.0	-5.4	W
18.507360	43.7	0.4		0.2		44.3	50.0	-5.7	W
20.119980	43.8	0.4		0.2		44.4	50.0	-5.6	W

21.327180	43.9	0.3		0.2		44.4	50.0	-5.6	W

Test Method: ANSI C63.4 (1992)
Spec Limit: FCC Part 15 Subpart C Section 15.207

NOTES: W = White Lead

COMMENTS: EUT is an RFID reader. Each I/O port is terminated its characteristic impedance. The EUT is powered through a standard DC power supply representative of one used in normal installation. An RFID tag is present in the field. The transmitter is operating continuously at 134.2 kHz. Frequency Range Investigated: 150 kHz to 30 MHz. Temperature 68°F, Humidity 39%.

Table 2: 15.209 Fundamental Emission Levels

FREQUENCY MHz	METER READING dB μ V	CORRECTION FACTORS				CORRECTED READING dB μ V/m	SPEC LIMIT dB μ V/m	MARGIN dB	NOTES
		Ant dB		Corr dB					
0.134	63.0	9.6		-60.0		12.6	25.0	-12.4	V
0.134	62.9	9.6		-60.0		12.5	25.0	-12.5	V
0.134	62.9	9.6		-60.0		12.5	25.0	-12.5	V
0.134	55.2	9.6		-60.0		4.8	25.0	-20.2	H

Test Method: ANSI C63.4 (1992)
 Spec Limit: FCC Part 15 Subpart C Section 15.209
 Test Distance: 10 Meters

NOTES: H = Horizontal Polarization
 V = Vertical Polarization

COMMENTS: EUT is an RFID reader. Each I/O port is terminated its characteristic impedance. The EUT is powered through a standard DC power supply representative of one used in normal installation. An RFID tag is present in the field. The transmitter is operating continuously at 134.2 kHz. Data is extrapolated to proper test distance for comparison to the applicable limit in accordance with 15.33, 40dB per decade. Frequency Range Investigated: 9 kHz to 30 MHz. Temperature 68°F, Humidity 37%.

Table 3: 15.209 Six Highest Radiated Emission Levels

FREQUENCY MHz	METER READING dB μ V	CORRECTION FACTORS				CORRECTED READING dB μ V/m	SPEC LIMIT dB μ V/m	MARGIN dB	NOTES
		Ant dB	Amp dB	Cable dB	Dist dB				
30.040	41.2	12.9	-27.3	0.7	10.0	37.5	40.0	-2.5	VQ
30.315	40.8	12.8	-27.3	0.7	10.0	37.0	40.0	-3.0	VQ
56.835	43.3	9.8	-27.3	1.1	10.0	36.9	40.0	-3.1	V
58.505	43.4	9.6	-27.3	1.1	10.0	36.8	40.0	-3.2	VQ
59.030	45.2	9.6	-27.3	1.1	10.0	38.6	40.0	-1.4	VQ
59.580	44.0	9.5	-27.3	1.1	10.0	37.3	40.0	-2.7	VQ

Test Method: ANSI C63.4 (1992)
Spec Limit: FCC Part 15 Subpart C Section 15.209
Test Distance: 10 Meters

NOTES: Q = Quasi Peak Reading
V = Vertical Polarization

COMMENTS: EUT is an RFID reader. Each I/O port is terminated its characteristic impedance. The EUT is powered through a standard DC power supply representative of one used in normal installation. An RFID tag is present in the field. The transmitter is operating continuously at 134.2kHz. Temperature 68°F, Humidity 39%.

Frequency Range Investigated: 9 kHz to 30 MHz. Data is extrapolated to proper test distance for comparison to the applicable limit in accordance with 15.33, 40dB per decade. Data represent noise floor readings. No EUT readings were found below 30 MHz.

Frequency Range Investigated: 30 MHz to 1000 MHz. Data is extrapolated to 3 meters for comparison to the applicable limit in accordance with 15.33, 20dB per decade.

MEASUREMENT UNCERTAINTY

TEST	HIGHEST UNCERTAINTY
Radiated Emissions	+/- 2.94 dB
Conducted Emissions	+/- 1.56 dB

Note: Reported uncertainties represent expanded uncertainties expressed at approximately the 95% confidence level using a coverage factor of k=2. Statements of compliance are based on the nominal values only.

EUT SETUP

The equipment under test (EUT) was set up in a manner that represented its normal use, as shown in the photographs in Appendix A. Any special conditions required for the EUT to operate normally are identified in the comments that accompany the emissions tables. The corrected data was then compared to the applicable emission limits to determine compliance.

The cables were routed consistent with the typical application by varying the configuration of the test sample. Interface cables were connected to the available I/O ports of the test unit. The effect of varying the position of the cables was investigated to find the configuration that produced maximum emissions. I/O cables were of the type and length specified in the individual requirements. The length of cable that produced maximum emissions was selected.

The radiated and conducted emissions data of the EUT was taken with the HP Spectrum Analyzer. Incorporating the applicable correction factors for distance, antenna, cable loss and amplifier gain, the data was reduced as shown in Table A.

Preliminary and final measurements were taken in order to ensure that all emissions from the EUT were found and maximized.

CORRECTION FACTORS

The basic spectrum analyzer reading was converted using correction factors as shown in the highest emissions readings in the tables. For radiated emissions in dB μ V/m, the spectrum analyzer reading in dB μ V was corrected by using the following formula in Table A. This reading was then compared to the applicable specification limit to determine compliance.

TABLE A: SAMPLE CALCULATIONS		
	Meter reading	(dB μ V)
+	Antenna Factor	(dB)
+	Cable Loss	(dB)
-	Distance Correction	(dB)
-	Preamplifier Gain	(dB)
=	Corrected Reading	(dB μ V/m)

TEST INSTRUMENTATION AND ANALYZER SETTINGS

The test instrumentation and equipment listed in Appendix B were used to collect both the radiated and conducted emissions data. For radiated measurements from 9 kHz to 30 MHz, the magnetic loop antenna was used. For radiated measurements below 300 MHz, the biconical antenna was used. For frequencies from 300 to 1000 MHz, the log periodic antenna was used. Conducted emissions tests required the use of the FCC type LISNs.

The HP spectrum analyzer was used for all measurements. Table B shows the analyzer bandwidth settings that were used in designated frequency bands. For conducted emissions, an appropriate reference level and a vertical scale size of 10 dB per division were used. A 10 dB external attenuator was also used during conducted tests, with internal offset correction in the analyzer. During radiated testing, the measurements were made with 0 dB of attenuation, a reference level of 97 dB μ V, and a vertical scale of 10 dB per division.

SPECTRUM ANALYZER DETECTOR FUNCTIONS

The notes that accompany the measurements contained in the Tables indicate the type of detector function used to obtain the given readings. Unless otherwise noted, all readings were made in the "Peak" mode. Whenever a "Quasi-Peak" or "Average" reading is listed as one of the six highest readings, this is indicated as a "Q" or an "A" in the appropriate table. The following paragraphs describe in more detail the detector functions and when they were used to obtain the emissions data.

Peak

In this mode, the Spectrum Analyzer or test engineer recorded all emissions at their peak value as the frequency band selected was scanned. By combining this function with another feature of the analyzer called "peak hold," the analyzer had the ability to measure transients or low duty cycle transient emission peak levels. In this mode the analyzer made a slow scan across the frequency band selected and measured the peak emission value found at each frequency across the band.

Quasi-Peak

When the true peak values exceeded or were within 2 dB of the specification limit, quasi-peak measurements were taken using the HP Quasi-Peak Adapter for the HP Spectrum Analyzer. The detailed procedure for making quasi peak measurements contained in the HP Quasi-Peak Adapter manual were followed.

Average

For certain frequencies, average measurements may be made using the spectrum analyzer. To make these measurements, the test engineer reduces the video bandwidth on the analyzer until the modulation of the signal is filtered out. At this point the analyzer is set into the linear mode and the scan time is reduced.

TESTING

Mains Conducted Emissions

During conducted emissions testing, the EUT was located on a wooden table measuring approximately 80 cm high, 1 meter deep, and 1.5 meters in length. One wall of the room where the EUT was located has a minimum 2 meter by 2 meter conductive plane. The EUT was mounted on the wooden table 40 cm away from the conductive plane, and 80 cm from any other conductive surface.

The vertical metal plane used for conducted emissions was grounded to the earth. Power to the EUT was provided through a LISN. The LISN was grounded to the ground plane. All other objects were kept a minimum of 80 cm away from the EUT during the conducted test.

The LISNs used were 50 μ H/+50 ohms. Above 150 kHz, a 0.15 μ F series capacitor was added in-line prior to connecting the analyzer to restore the proper impedance for the range. A 30 to 50 second sweep time was used for automated measurements in the frequency bands of 150 kHz to 500 kHz, and 500 kHz to 30 MHz. All readings within 20 dB of the limit were recorded, and those within 6 dB of the limit were examined with additional measurements using a slower sweep time.

Radiated Emissions

The EUT was mounted on a nonconductive, rotating table 80 cm above the conductive grid. The nonconductive table dimensions were 1 meter by 1.5 meters.

During the preliminary radiated scan, the EUT was powered up and operating in its defined FCC test mode. For radiated measurements from 9 kHz to 30 MHz, the magnetic loop antenna was used. The frequency range of 30 MHz to 88 MHz was scanned with the biconical antenna located about 1.5 meter above the ground plane in the vertical configuration. During this scan, the turntable was rotated and all peaks at or near the limit were recorded. The frequency range of 100 to 300 MHz was then scanned in the same manner using the biconical antenna and the peaks recorded. Lastly, a scan of the FM band from 88 to 110 MHz was made, using a reduced resolution bandwidth and frequency span. The biconical antenna was changed to the horizontal polarity and the above steps were repeated. After changing to the log periodic antenna in the horizontal configuration, the frequency range of 300 to 1000 MHz was scanned. The log periodic antenna was changed to the vertical polarity and the frequency range of 300 to 1000 MHz was again scanned. Care was taken to ensure that no frequencies were missed within the FM and TV bands. An analysis was performed to determine if the signals that were at or near the limit were caused by an ambient transmission. If unable to determine by analysis, the equipment was powered down to make the final determination if the EUT was the source of the emission.

A thorough scan of all frequencies was made manually using a small frequency span, rotating the turntable as needed. The test engineer maximized the readings with respect to the table rotation, antenna height, and configuration of EUT. Maximizing of the EUT was achieved by monitoring the spectrum analyzer on a closed circuit television monitor.

Model: **ATR-9100**

S/N: **C1**

Equipment Under Test (* = EUT):

Function	Manufacturer	Model #	S/N
RFID Reader*	Asyst Technologies	ATR-9100	C1

Support Devices:

Function	Manufacturer	Model #	S/N
Power Supply	Sola	SLS-24-012T	8869 0150

Test Conditions / Notes:

EUT is an RFID reader. Each I/O port is terminated its characteristic impedance. The EUT is powered through a standard DC power supply representative of one used in normal installation. An RFID tag is present in the field. The transmitter is operating continuously at 134.2kHz. Data is extrapolated to proper test distance for comparison to the applicable limit in accordance with 15.33, 40dB per decade. **Data represent noise floor readings. No EUT readings were found below 30 MHz.** Frequency Range Investigated: 9 kHz to 30 MHz. Temperature 68°F, Humidity 37%.
