2.0 General Description**2.1 Product Description***EQUIPMENT UNDER TEST**Type of equipment* Wireless Video Transmitter*Type/Model* CE-T010*EUT description**Video Camera :*

- 1/3-inch CCD Image Sensor
- Resolution: Horizontal 420 TV lines
- Sensitivity: 0.05 LUX
- Automatic Exposure Control
- Pinhole Lens, 90° Field of View

RF Transmitter:

- Type of Emission: F3F
- Frequency: 900 MHz ISM Band.
- Can be configured to operate on one of four fixed frequencies: 909, 914, 919, 924 MHz
- Output Power: 0 dBm
- Modulation: FM
- Antennas: ¼ Wave Vertical Antenna (permanently attached)
- Batteries: Up to 4 hours of continuous operation with Lithium Polymer Pack

2.2 Related Submittal(s) Grants

This report is for use with an application for certification of a low power transmitter. One transmitter is included in the application. This specific report details the emission characteristics of transmitter.

2.3 Test Methodology

Both AC mains line-conducted and radiated emission measurements were performed according to the procedures in ANSI C63.4 (2003). Radiated emission measurements were performed in 10 m OATS. All Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the **"Justification Section"** of this Application.

2.4 Test Facility

The test facility was a specially designed and constructed Open Area Test Site (OATS).

Test site included a metal ground plane constructed of 22-gauge sheet metal. It contained a 2.5 meter diameter turntable for floor standing equipment, and a fiber glass table measuring 1.5 x 1.5 x 0.8 meters for table top equipment. To facilitate testing, also it has heat and air conditioning systems to control environmental test conditions.

This test facility and site measurement data have been fully placed on file with the FCC, Industry of Canada and A2LA accredited.

Test Facility: Intertek ETL Semko
27611 La Paz Road, Suite C
Laguna Niguel, CA 92677

Accreditations:

FCC	Registration Number: 90711
A2LA	Certificate Number: 2085-01
IC	Reference Number: IC 3753

Date of Test: August 22 to 24, 2005

FCC ID: PO288CE-T010

3.0 System Test Configuration

3.1 Justification

For emission testing, the equipment under test (EUT) was configured for testing in a typical fashion (as a customer would normally use it). During testing, all cables were manipulated to produce worst case emissions.

For the measurements, the EUT is attached to a cardboard box (if necessary) and placed on the fiber glass turntable. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). The EUT is wired to transmit full power.

The signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters.

Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance.

3.2 EUT Exercising Software

No software was required to exercise the EUT.

3.3 System Test Configuration

3.3.1 Support Equipment

No support equipment was required to operate the EUT.

Date of Test: August 22 to 24, 2005

FCC ID: PO288CE-T010

3.3.2 Block Diagram of Test Setup

--------------------	----------------------	-----------------------------

Support Equipment					
Equip.#	Equipment	Manufacturer	Model #	S/N #	FCC ID
None					

3.4 Equipment Modification

None

3.5 Mode(s) of operation

The EUT was powered from fully charged batteries. During the tests EUT was operating at continuous transmitting mode

Date of Test: August 22 to 24, 2005

FCC ID: PO288CE-T010

4.0 Field Strength of Emission**4.1 Test Description**

Parameter:	FCC 15.249a
Requirement:	FCC 15.249a
Fundamental:	Limit 94 dB μ V
Harmonics:	Limit 54 dB μ V

4.1.1 Test Procedure

For the measurements, the EUT is attached to a cardboard box (if necessary) and placed on the wooden turntable which is 0.8 m above the ground plane on the open test site. If the EUT attaches to peripherals, they are connected and operational (as typical as possible). The EUT is wired to transmit full power. The signal is maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization are varied during the search for maximum signal level. The antenna height is varied from 1 to 4 meters. Radiated emissions are taken at three meters unless the signal level is too low for measurement at that distance. If necessary, a pre-amplifier is used and/or the test is conducted at a closer distance. All readings are extrapolated back to the equivalent three meter reading using inverse scaling with distance. Radiated emission measurements were performed from 30 MHz to the 10th harmonic of transmitter frequency. Analyzer resolution is 120 KHz for 30 to 1000 MHz, 1 MHz for >1000 MHz. This test was performed per test procedure specified in ANSI C63.4 (2003).

4.1.2 Field Strength Calculation

The field strength is calculated by adding the reading on the Spectrum Analyzer to the factors associated with antennas, cables, preamplifiers (if any) and average factors (when specified limits is in average and measurements are made with peak detectors) The basic equation with a sample calculation is as follows:

$$FS = RA + AF + CF - AG + AV$$

where FS = Field Strength in dB(μ V/m)

RA = Receiver Amplitude in dB(μ V)

CF = Cable Attenuation Factor in dB

AF = Antenna Factor in dB/m

AG = Amplifier Gain in dB

Assume a receiver reading of 52.0 dB(μ V) is obtained. The antenna factor of 7.4 dB/m and cable factor of 1.6 dB is added. The amplifier gain of 29 dB is subtracted, giving a field strength of 32 dB(μ V/m).

$$RA = 52 \text{ dB}(\mu\text{V})$$

$$CF = 1.6 \text{ dB}$$

$$AF = 7.4 \text{ dB/m}$$

$$AG = 29 \text{ dB}$$

$$FS = 52 + 7.4 + 1.6 - 29 = 32 \text{ dB}(\mu\text{V/m})$$

This value in dB(μ V/m) was converted to its corresponding level in μ V/m.

Level in μ V/m = Common Antilogarithm $\{[32 \text{ dB}(\mu\text{V/m})]/20\} = 39.8 \mu\text{V/m}$

Note: In the following table(s), the level shown on the data table includes the antenna factor, cable factor and preamplifier gain.

Notes:

- The field strength shown in the table (Vertical and Horizontal levels) included Antenna factor, Cable loss and Pre-amplifier Gain (if applicable).
- Negative signs (-) in Margin column signify levels below the limits.
- For frequencies below 1000 MHz the, above limits are based on quasi-peak limits.
Analyzer setting: RBW =120 KHz, VBW =300 KHz
- For frequencies above 1000 MHz the, above limits are based on average limits.
Analyzer setting: RBW =1 MHz, VBW =1 MHz
- Peak measurement shown for the compliance with 15.35b (peak measurements of emission shall not exceed the average limits specified above by more than 20 dB).
- All other emissions not reported are below the equipment noise floor which is at least 6 dB below the limits.
- D.C.F: Distance Correction Factor.

Date of Test: August 22 to 24, 2005

FCC ID: PO288CE-T010

h) * Restricted Frequency Band. Only spurious emissions are permitted (15.205).

Test Result	Passed with margin 2.4 dB at 914 MHz. ** The measurement result is below the specification limit by a margin less than the measurement uncertainty; it is not therefore possible to determine compliance at a level of confidence of 95%. However, the measured result indicates a high probability that the product tested complies with the specification limit

5 Out of Band Emission

5.1 Test Description

Parameter:	FCC 15.249c
Requirement:	FCC 15.249c
Attenuation limits	> 50 dB or FCC 15.209

5.2 Test Procedure

These measurements performed inside the semi anechoic chamber. For measurements below 1 GHz, a biconilog antenna was used. For measurements above 1 GHz, a horn antenna was used. Several plots were made to show emissions from 30 MHz up to 7th harmonic.

5.3 Test Results

The following plots show the relative spurious emission levels of the transmitter.

Plot #	Description
5.3.1	Plot shows peak measurements differential between fundamental and frequency range from 30 to 902 MHz. Complies with >50 dB, except @ f = 601.4 MHz complies with 15.209 (see section 4.3).
5.3.2	Plot shows peak measurements differential between fundamental @ 904 MHz and lower edge of the frequency band. Complies with >50 dB.
5.3.3	Plot shows peak measurements differential between fundamental @ 904 MHz and upper edge of the frequency band. Complies with >50 dB.
5.3.4	Plot shows peak measurements differential between fundamental @ 914 MHz and lower edge of the frequency band. Complies with >50 dB.
5.3.5	Plot shows peak measurements differential between fundamental @ 914 MHz and upper edge of the frequency band. Complies with >50 dB.
5.3.6	Plot shows peak measurements differential between fundamental @ 924 MHz and lower edge of the frequency band. Complies with >50 dB.
5.3.7	Plot shows peak measurements differential between fundamental @ 924 MHz and upper edge of the frequency band. Complies with >50 dB.
5.3.8	Plot shows peak measurements differential between fundamental and frequency range from 902 to 2000 MHz. Complies with >50 dB.
5.3.9	Plot shows no spurious emission from 2000 to 4000 MHz. It also shows compliance with 50 dB below the level of fundamental (complies with >50 dB)
5.3.10	Plot shows no spurious emission from 4000 to 6500 MHz. It also shows compliance with 50 dB below the level of fundamental (complies with >50 dB)

Note 1: There are no emissions observed above 3rd harmonic of fundamental frequency. All spurious emissions outside the frequency band 902 – 928 MHz are attenuated by more than 50 dB below the level of fundamental or below the limits specified in 15.209

Plot 5.3.10

Date of Test: August 22 to 24, 2005

FCC ID: PO288CE-T010**6.0 Antenna Requirement****6.1 Test description**

Parameter:	FCC 15.203
Requirement:	FCC 15.203
Descriptions:	No antenna other than furnished by the responsible party shall be used with the device.

6.2 Test Procedure

None

6.3 Test Result

The device is considered to comply with the requirements by:

	Description
X	The transmitter uses a permanently connected antenna.
	The antenna is affixed to the EUT using a unique connector which allows for replacement of a broken antenna, but does NOT use a standard antenna jack or electrical connector.

Date of Test: August 22 to 24, 2005

FCC ID: PO288CE-T010

7.0 TEST EQUIPMENT

Measurement equipment used for emission compliance testing utilized the equipment on the following list:
