FCC-Certificate of Compliance

Test Report No.:	SKTFCE-060204-013		
NVLAP CODE :	200220-0		
Applicant:	softDSP Co., Ltd.		
Applicant Address:	Jungil Bldg 203, 552-1 Sungnae-dong, Kangdong-ku, Seoul, Korea		
Manufacturer :	softDSP Co., Ltd.		
Manufacturer Address:	Jungil Bldg 203, 552-1 Sungnae-dong, Kangdong-ku, Seoul, Korea		
Product:	Dynamic Signal Analyzer		
FCC ID:	PO6SDU2040	Model No.:	SDU 2040
Receipt No.:	SKTEU05-0787	Date of receipt:	Dec. 22, 2005
Date of Issue:	Feb. 04, 2006		
Testing location:	SK TECH CO., LTD. 820-2, Wolmoon-Ri, Wabu-Up, Namyangju-Si, Kyunggi-Do, Korea		
Test Standards:	ANSI C63.4 / 2003		
Rule Parts:	FCC part 15 Subpart B		
Equipment Class :	Class B Digital Device Peripheral		
Test Result:	The above mentioned product has been tested and passed.		
Prepared by: S.Y.Ye		Tested by: S.Y.Yoon/Engineer

1. General

This equipment has been shown to be capable of compliance with the applicable technical standards and was tested in accordance with the measurement procedures as indicated in this report.

We attest to the accuracy of data. All measurements reported herein were performed by SK Tech Co., Ltd. and were made under Chief Engineer's supervision.

We assume full responsibility for the completeness of these measurements and vouch for the qualifications of all persons taking them.

2. Test Site

SK TECH Co., Ltd.

2.1 Location

820-2, Wolmoon Ri, Wabu-Up, Namyangju-Si, Kyunggi-Do, Korea

The test site is in compliance with ISO/IEC 17025 for general requirements for the competence of testing and calibration laboratories.

This laboratory is accredited by NVLAP for NVLAP Lab. Code : 200220-0 and DATech for DAR-Registration No.:DAT-P-076/97-01

2.2 List of Test and Measurement Instruments

Table 1 : List of Test and Measurement Equipment

- **Conducted Disturbance**

Kind of Equipment	Type	S/N	Calibrated until
EMI Receiver	ESHS10	835871/002	09.2006
Artificial Mains Network	ESH3-Z5	836679/018	08.2006

- **Radiated Disturbance**

Kind of Equipment	Type	S/N	Calibrated until

2.3 Test Date

Date of Application : Dec. 22, 2005

Date of Test : Jan. 20, 2006 ~ Jan. 24, 2006

2.4 Test Environment

See each test item's description.

3. Description of the tested samples

The EUT is a Dynamic Signal Analyzer.

The USB cable from the EUT branches into two.

One is for both Data transformation and power supply, the other is for only power supply.

3.1 Rating and Physical Characteristics

ITEM	SPECIFICATION	
General specification		
Environment	Operating	0℃~50℃, 10% ~ 80% RH.
	Input Power	USB Powered 5V DC
	Computer Communication	USB Interface
	Warm-up	20 minute
Analog Specifications		
Analog inputs	Channels	4 Channels
	Input Connector	BNC Connector
	Input Configuration	Unbalanced Differential
	Resolution	24Bit
	Over Voltage Protection	42Vpeak
	Offset Voltage	±3mV
	Bandwidth	50kHz
	Type of ADC	Delta Sigma
	Sampling Rate	Max 216KS/sec
	AC Cutoff Frequency	3.5Hz
	Input Impedance	1MΩ
	Input Coupling	AC/DC Coupling
	Input Range	Max ±10V
Low-Pass Filter		
	Pass Band	10S/sec ~ 4KS/sec 8KS/sec ~ 216KS/sec

SK TECH CO., LTD.

	Stop Band	10S/sec ~ 4KS/sec 8KS/sec ~ 216KS/sec
Alias Rejection		
	Amplitude Accuracy Total Harmonic Distortion ICP Bias Current	(Fin < Fc/2) 4mA
Analog outputs		
	Channel	2 Channels
	Signal Connection	BNC Connector
	Frequency Range	
	Amplitude Setting	Max ±10Vpp
	Output Impedance	50Ω
	Waveform Mode	SINE, SQUA, TRIA, RAMP, DC
Counter		
	Channels	1 Channel
	Connector	BNC Connector
	Input Level	TTL Compatible
External Trigger		
	Channels	1 Channel
	Connector	BNC Connector
	Input Level	TTL Compatible

3.2 Submitted Documents

N/A

4. Measurement Conditions

The EUT was supplied power via USB cable from PC.

4.1 Modes of Operation

The EUT analyzed the signal generated by itself.

This image was displayed on the LCD Monitor

4.4 Test Setup

The test setup photographs showed the external supply connections and interfaces.

[System Block Diagram of Test Configuration]

4.5 Uncertainty

1) Radiated disturbance

- Radiated disturbances from 30 MHz to 1000 MHz at a distance of 3m and 10 m

Input quantity	X_i	Probability distribution function
Receiver reading	V_r	Rectangular $\sqrt{3}$
Attenuation: antenna-receiver	L_c	$k=1$
Amplifier Error	A_e	$k=2$
antenna factor	L_{ac}	$k=2$
Receiver corrections:		
Sine wave voltage	dV_{sw}	Rectangular $\sqrt{3}$
Pulse amplitude response	dV_{pa}	Rectangular $\sqrt{3}$
Pulse repetition rate response	dV_{pr}	Rectangular $\sqrt{3}$
Mismatch: antenna-receiver	dM	$k=1$
Antenna corrections:		
AF frequency interpolation	dA_{ff}	Rectangular $\sqrt{3}$
AF height deviations	dA_{fh}	Rectangular $\sqrt{3}$
Directivity difference	dA_{dir}	3 m: Rectangular $\sqrt{3}$, 10 m: Rectangular $\sqrt{3}$
Phase centre location	dA_{ph}	3 m: Rectangular $\sqrt{3}$, 10 m: Rectangular $\sqrt{3}$
Cross-polarisation	dA_{cp}	Rectangular $\sqrt{3}$
Balance	dA_{bal}	Rectangular $\sqrt{3}$
Site corrections:		
Site imperfections	dS_A	Rectangular $\sqrt{6}$
Separation distance	dd	3 m: Rectangular $\sqrt{3}$, 10 m: Rectangular $\sqrt{3}$
Table height	dh	3 m: $k=2$, 10 m: $k=2$
Expanded Uncertainty		4.60(Vertical)/4.59(Horizontal) $k=2$ (Level of confidence)

Expanded Uncertainty

$$U = k * U_c(x_i) = 2 * 2.3 = 4.60\text{dB}$$

The coverage factor $k=2$ yields approximately a 95% level of confidence.

2) Conducted disturbance

- Conducted disturbance from 150 KHz to 30 MHz using a 50 Ω /50 μH AMN

Input quantity	X_i	Probability distribution function
Receiver reading	V_r	Rectangular $\sqrt{3}$
Attenuation: AMN-receiver	L_c	$k=1$
AMN voltage division factor	L_{amn}	$k=2$
Receiver corrections:		
Sine wave voltage	dV_{sw}	Rectangular $\sqrt{3}$
Pulse amplitude response	dV_{pa}	Rectangular $\sqrt{3}$
Pulse repetition rate response	dV_{pr}	Rectangular $\sqrt{3}$
Mismatch: AMN-receiver	dM	U-shape $\sqrt{2}$
AMN impedance	dZ	Triangular $\sqrt{6}$
Expanded Uncertainty		3.99 $k=2$ (Level of confidence)

Expanded uncertainty

$$U = k * U_c(x_i) = 2 * 1.96 = 3.92\text{dB}$$

The coverage factor $k=2$ yields approximately a 95% level of confidence.

5. EMISSION Test

5.1 Conducted Emissions

Result:**PASS**

The line-conducted facility is located inside a 2.6M x 3.6M x 7.0M shielded enclosure.

The shielding effectiveness of the shielded room is in accordance with MIL-Std-285 or NSA 604-05.

A 1 m x 1.5 m wooden table 80 cm high is placed 40 cm. away from the vertical wall and 1.5 m away from the side wall of the shielded room. ROHDE & SCHWARZ Model ESH3-Z5 (10 kHz-30 MHz) 50 ohm/50 uH Line-Impedance Stabilization Networks(LISNs) are bonded to the shielded room.

The EUT is powered from the ROHDE & SCHWARZ LISN and the support equipment is powered from the ROHDE & SCHWARZ LISN. Power to the LISNs are filtered by a high-current high-insertion loss Lindgren enclosures power line filters (100dB 14 kHz-10 GHz).

The purpose of the filter is to attenuate ambient signal interference and this filter is also bonded to the shielded enclosure.

All electrical cables are shielded by braided tinned copper zipper tubing with inner diameter of 1/2".

If the EUT is a DC-powered device, power will be derived from the source power supply it normally will be powered from and this supply lines will be connected to the ROHDE & SCHWARZ LISN.

All interconnecting cables more than 1 meter were shortened by non-inductive bundling (serpentine fashion) to a 1-meter length.

Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. The RF output of the LISN was connected to the spectrum analyzer to determine the frequency producing the maximum EME from the EUT.

The spectrum was scanned from 150 kHz to 30 MHz with 100msec. sweep time.

The frequency producing the maximum level was reexamined using EMI/field Intensity Meter (ESHS 10) and Quasi-Peak adapter. The detector function was set to CISPR quasi-peak mode.

The bandwidth of the receiver was set to 10 kHz. The EUT, support equipment, and interconnecting cables were arranged and manipulated to maximize each EME emission.

Each emission was maximized by: switching power lines; varying the mode of operation or resolution; clock or data exchange speed; if applicable; whichever determined the worst-case emission.

Photographs of the worst-case emission can be seen in photograph of conducted test.

Each EME reported was calibrated using self-calibrating mode.

**Figure 1: Test Data, Conducted Disturbance****<Quasi-Peak>**

Frequency (MHz)	Reading (dBuV)	Line	C/F (dB)	C/L (dB)	Actual (dBuV)	Limit (dBuV)	Margin (dB)
0.150	51.73	N	0.12	0.01	51.86	66.00	14.14
0.435	41.43	L	0.13	0.04	41.60	57.16	15.56

5.2 Radiated Emissions

Result :**PASS**

Preliminary measurements were made indoors at 3 meter using broadband antennas, broadband amplifier, and spectrum analyzer to determine the frequency producing the maximum EME.

Appropriate precaution was taken to ensure that all EME from the EUT were maximized and investigated. The system configuration, clock speed, mode of operation or video resolution, turntable azimuth with respect to the antenna were noted for each frequency found.

The spectrum was scanned from 30 to 300 MHz using biconical antenna and from 300 to 1000 MHz using log-periodic antenna. Above 1 GHz, linearly polarized double ridge horn antennas were used.

Final measurements were made outdoors at 3-meter test range using SCHWARZBECK dipole antennas.

The test equipment was placed on a wooden table situated on a 4x4 meter area adjacent to the measurement area. Turntable was to protect from weather in the dome that made with FRP.

Sufficient time for the EUT, support equipment, and test equipment was allowed in order for them to warm up to their normal operating condition. Each frequency found during pre-scan measurements was re-examined and investigated using EMI/Field Intensity Meter(ESVS 10) and Quasi-Peak Adapter.

The detector function was set to CISPR quasi-peak mode and the bandwidth of the receiver was set to 100 kHz or 1 MHz depending on the frequency or type of signal.

The half-wave dipole antenna was tuned to the frequency found during preliminary radiated measurements. The EUT, support equipment and interconnecting cables were re-configured to the set-up producing the maximum emission for the frequency and were placed on top of a 0.8-meter high non-metallic 1 x 1.5 meter table.

The EUT, support equipment, and interconnecting cables were re-arranged and manipulated to maximize each EME emission. The turntable containing the system was rotated; the antenna height was varied 1 to 4 meters and stopped at the azimuth or height producing the maximum emission.

Each emission was maximized by: varying the mode of operation or resolution; clock or data exchange speed, and/or support equipment, if applicable; and changing the polarity of the antenna, whichever determined the worst-case emission.

Photographs of the worst-case emission can be seen in photograph of radiated emission test.

Each EME reported was calibrated using self-calibrating mode.

**Table 2 : Test Data, Radiated Emissions**

Frequency [MHz]	Pol.	Height [m]	Real Reading	Correction Factor		T-Fact [dB]	Data [dBuV/m]	Limits [dBuV/m]	Margin [dB]
				Antenna	Cable

Table. Radiated Measurements at 10-meters

NOTES:

1. All modes of operation were investigated and the worst-case emission are reported.
2. All other emission are non-significant.
3. All readings are calibrated by self-mode in receiver.
4. Measurements using CISPR Quasi-peak mode.
5. H = Horizontal, V = Vertical Polarization
6. Data = Real Reading + T - Factor(Antenna+Cable)
7. Margin = Limits - Data
