EQUIPMENT: S75 Satellite Receiver

Section 1. Summary of Test Results**General:****All measurements are traceable to national standards.**

These tests were conducted on a sample of the equipment for the purpose of demonstrating compliance with FCC Part 15, Subpart B for Class B Digital Devices.

These tests were conducted using measurement procedures of ANSI C63.4-1992.

The equipment was tested for conducted emissions from 0.45 MHz to 30 MHz using a 50 microhenry line impedance stabilization network (L.I.S.N.) as described in ANSI C63.4-1992. Peripheral equipment was also operated through a 50 microhenry L.I.S.N.

Abstract:

Name Of Test	Para. No.	Results
Conducted Emissions	15.107	Complied
Radiated Emissions	15.109	Complied

THIS TEST REPORT APPLIES ONLY TO THE ITEM(S) TESTED.

EQUIPMENT: S75 Satellite Receiver

Section 2. Equipment Under Test

Brand Name: Novra

Manufacturer: Novra Technologies Inc.

Model No.: S75-0100

Serial No.: 1301

Date Received In Laboratory: May 6, 2002

Nemko Identification No.: Item #3

Production Unit

Pre-Production Unit

Description of EUT

The S75 is a DVB (Digital Video Broadcast) satellite receiver with a tuning frequency of 950-2150MHz.

Modifications Incorporated in EUT

The EUT was not modified from what is described by the brand name and unique type identification stated above.

EQUIPMENT: S75 Satellite Receiver

Theory of Operation

The receiver is connected to a LNB (Low Noise Block) via a 75 Ω coax and via Ethernet cable to a PC. The user configures the unit via a Management Console on the PC. The main parameters set are the network parameters and the receiver parameters (symbol rate and receive frequency).

Justification

The EUT was configured for testing as per typical installation. Position and bundling of cables were investigated to establish maximum amplitude of emissions.

The following combinations were investigated to establish worst case configuration:

- (1) Sat In port was terminated during testing
- (2) Unit was tested while the f_o was set for 2150MHz and set at a bite rate of 20Msps; it was determined to be worst case by prescans

Exercise Mode:

The EUT exercise program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to typical use.

Exercise Program:

- (1) The EUT was tested while connected to a laptop and communicating via the Ethernet port.
- (2) The software in the laptop used to control the EUT was “S75 Management Console Version 1.0.17” and “S75 E2D Version 1.14”
- (3) The software in the EUT was “S75 Hardware Version 5.0 Revision 0.0”

EQUIPMENT: S75 Satellite Receiver

Section 3. Equipment Configuration

Equipment Configuration List:

Item	Description	Model No.	Serial No.	Rev.
(A)	S75 Satellite Receiver (EUT)	S75-0100	1301	----
(B)	Sceptre AC/DC Power Converter	SPU24-6	None	----
(C)	Apple Laptop Computer	M5884	QT10619FK6B	----

Equipment Ports:

Item	Description	Number
(i)	24V DC Power Input	1
(ii)	Sat In	1
(iii)	Ethernet	1

Inter-Connection Cables:

Item	Description	Length (m)
(1)	2 Conductor DC Power Cable	1.8
(2)	75 Ω Terminated Coax Cable	2
(3)	Cat 5 Unshielded Ethernet Crossover Cable	1.8
(4)	North American Power Cord	1.8

EQUIPMENT: S75 Satellite Receiver

Configuration of the Equipment Under Test (EUT)

EQUIPMENT: S75 Satellite Receiver

Section 4. Conducted Emissions**Para. No.: 15.107****Test Performed By:** Daniel Hynes**Date of Test:** May 6, 2002

Test Conditions: Test Voltage: 120VAC
Temperature: 24°C
Humidity: 25%

Minimum Standard:

Frequency (MHz)	Maximum Powerline Conducted RF Voltage	
	μ V	dB μ V
0.45 - 30.0	250	48

Test Results: Complied. See attached graphs.

Measurement Data: See attached graphs and table.

Method Of Measurement: (Procedure ANSI C63.4-1992)

Measurements were made using a spectrum analyzer with 10 kHz RBW, Peak detector. Any emissions that were close to the limit are measured using a test receiver with 10 kHz bandwidth, CISPR Quasi-Peak detector.

Broadband emissions were identified by switching the receiver detector function from Quasi-Peak to Average. If the amplitude of the emission drops by 6 dB or more then the emission was classified as broadband and the Quasi-Peak level was reduced by a factor of 13 dB.

EQUIPMENT: S75 Satellite Receiver

Section 5. Radiated Emissions**Para. No.: 15.109**

Test Performed By: Daniel Hynes	Date of Test: May 6, 2002
--	----------------------------------

Test Conditions: Test Voltage: 120VAC
Temperature: 22°C
Humidity: 47%

Minimum Standard:

Frequency (MHz)	Maximum Field Strength at 3m	
	$\mu\text{V/m}$	$\text{dB}\mu\text{V/m}$
30 - 88	100	40.0
88 - 216	150	43.5
216 - 960	200	46.0
Above 960	500	54.0

Test Results: Complied. The worst-case emission level was 51.6 $\text{dB}\mu\text{V/m}$ @ 3m at 2152.13 MHz. This was 2.4 dB below the specification limit.

EQUIPMENT: S75 Satellite Receiver

Measurement Data:

The equipment was prescanned in a shielded room using a spectrum analyzer and broadband antenna. A list of frequencies was compiled for investigation in the open field. The equipment was then moved to an open area test site where amplitude measurements were made at a distance of 3 meters. The bandwidth was set to 120 kHz and the detector function was CISPR Quasi-Peak. Any emission within 3 dB of the specification limit is re-measured using a reference tuned dipole antenna per ANSI C63.4.

Emissions detected above 1 GHz were measured with horn antenna and low noise pre-amplifier at a distance of 3 meters.

The spectrum was investigated from 30MHz up to the frequency shown in the following table.

Highest Frequency Generated or Used in the Device Which the Device Operates or Tunes (MHz)	Upper Frequency of Measurement Range (MHz)
Below 1.075	30
1.705 – 108	1000
108 – 500	2000
500 – 1000	5000
Above 1000	5 th harmonic of the highest frequency or 40 GHz, whichever is lower.

The highest operational frequency used in the EUT was 2150 MHz.

The top six (6) emissions within 20 dB of the limit have been recorded.

Test Data - Radiated Emissions

Section 6. Sample Calculations

Conducted Emissions

If the Quasi-Peak to Average ratio was greater than 6 dB, then the emission was classified as broadband and its Quasi-Peak level was reduced by 13 dB for comparison to the limit.

i.e. Quasi-Peak level = 40 dB μ V
 Average level = 34 dB μ V
 Corrected level = 40 - 13 = 27 dB μ V

Radiated Emissions

Emissions were measured at a distance of 3 meters and corrected for antenna factor and cable loss.

i.e. Received Signal = 25 dB μ V @ 100 MHz
 Antenna Factor & Cable Loss = 9.8 dB
 Field Intensity = 25 + 9.8 = 34.8 dB μ V/m @ 3 m

EQUIPMENT: S75 Satellite Receiver

Section 7. Block Diagrams

Conducted Emissions

Radiated Prescan

EQUIPMENT: S75 Satellite Receiver

Outdoor Test Site For Radiated Emissions

The spectrum was searched up to 1GHz or the 5th harmonic of the highest oscillator frequency, which ever was higher, up to a maximum of 40GHz.
