▲ ▼	IDLE	Activates it with key tone volume adjustment.
	CALL	Activates it with call volume adjustment.
	MENU	Up/down from the menu.
Figure button	1	English : .
	2	English : abc
	3	English : def
	4	English : ghi
	5	English : jkl
	6	English : mno
	7	English : pqrs
	8	English : tuv
	9	English : wxyz
	0	English : oper

1.3 Display

- 128 * 128 LCD is used, and it supports 16 characters * 8 lines.
- All short messages are arranged to the right, and the number is arranged to the left.
- Supports Soft key method.

1.4 Icons

- Displays signal strength of the coverage area.
 - Receipt tone bell was set to vibration function.
 - Displayed after alarm setting.
 - Displays message receipt.
 - Displays call impossible area.
 - Displays analog, digital mode.
 - Displays service area.
 - Displays the remaining amount of the battery.
- * Occupies 2byte per entity. (ANT and battery with 3byte)

1.5 Power On/Off

- Press and hold 'End' to switch the phone on.
- After handset number is displayed first, and Power On animation is displayed.
- When you wish to switch the phone off, hold down END key for more than two seconds.

1.6 Idle mode

- The first line of LCD is for icons defined in '1.4'.
- Idle mode can be selected from '1. Banner' on Menu '5. Display'.

2. Basic Functions

2.1 Processing in IDLE state

2.1.1 'Menu' and 'Ack' processing in IDLE state

2.1.2 'Search' and 'Save' key processing upon number editing in IDLE state

2.2 Receiving a call

- If a call is received, it indicates a call by bell/ vibration/ vibration + bell/ non-sound set by users.
 - If a call is received, press any key to connect the call regardless of lock.
 - If a call is ended, press 'End' key.
- (Talk time flashes and returns to idle mode.)
- * Upon 'auto receipt function' setting, after the set time expires, it directly goes into busy state.
 - * If the service provider offers Caller ID service and Multi number service, phone number is displayed in the LCD.

2.3.2 Making a call with redial

- Numbers last dialed enables convenient calling next time.

2.3.2.1 Last number redial

- If you want to place a call again with the last dialed number, just press 'Send' key.
- Place a call with the last dialed number.

2.3.2.2 Last called number redial

- See '3. called number view' of Menu '1. Phone Book'.
- Last called numbers are displayed up to 10 numbers and a call is remade.

2.3.3 Placing a call with abbreviated dial

- Press only memorized address with phone number stored to dial quickly.

2.3.3.1 One-touch dialing

- For numbers stored in the memory address (01 ~ 09), press and hold only the back digit.

(e.g., 04 → only press and hold) 4

2.3.3.2 Two-touch dialing

- For numbers stored in the memory address (10 ~ 99), press shortly the front digit, and press and hold the back digit.

(e.g., if stored in address 14, press shortly , and 4 and hold) 4

2.3.3.3 Three-touch dialing

- If stored in the memory address (100 ~ 200), press shortly the first two-digit, and press and hold the rear digit.

(e.g., if stored in address 114, press shortly , 1 and 1 and hold) 4

2.4 Feature available during calls

- Convenient function that can be used while in busy state.

2.4.1 Send my number

- Sends my number during calls.

(e.g., used in cases where after call attempt, it passes into VMS, and it leaves my number to contact)

2.4.2 Memo

- This is to memorize phone number, account number, etc. from the other party.

(Memo contents in busy state are stored in the calling list.)

- Max. 32 characters can be entered.

- After volume adjustment, the set volume applies without pressing 'Ack' key.
- * Up key : Increases call volume.
- * Down key : Decreases call volume.

2.4.4 Block dial tone

- This is to make my voice blocked.
- * If talk is ended, it is automatically cleared.

2.5 SMS receipt

- SMS message can be received if there is a message, and processed in any state.
- If SMS is received in IDLE mode, an icon that indicates a message blinks, and according to user setting, the entire or partial contents of the message are displayed.
(see '2. message content display' of SMS Menu '5. message receipt setting')
- If SMS is received in busy state, an icon that indicates a message blinks only.

5. PIM

The Scheduler feature enables you to:

- View the calendar and organize your schedule
- Define a list of things to do
- Check the current time for 50 major cities around the world

5.1 View Schedule

- When you select the Calendar menu option (2-1), the current month calendar is displayed with the day highlighted with the cursor. To view the previous or next month, press or key on the left side of the phone.
- Upon selection of date, a schedule corresponding to the date is displayed.
- If you select a day for which a memo already exists, you can edit, add or delete the memo.

5.2 Add scheduler

1. Select the required date in the calendar, using the keys.
2. Press OK key.
3. Select the menu you want to set.
4. Enter the time and then press CONT key to write a memo
5. Enter your memo and then press SAVE key.

5.3 Alarm

- This is to set time so that alarm is generated one time per day or daily.

5.4 World time

- This can check the time of foreign countries.
- Displays the time of major 50 major cities.

5.5 Memo

- This enables users to record short messages.

- Up to 80 memos can be saved.

Upon selection of memo contents,
if there are no contents,
"No contents" is displayed.

6. RING

6.1 Ring type

- Sets phone bell type upon incoming call.
- The type includes 'bell/ vibration/ bell after vibration / no-sound(lamp)'.
 * Upon selection of vibration, bell after vibration, 'vibration' icon is displayed, and mobile phone vibrates for about 1 second the moment it is set up.
- * For manner mode, clear the manner mode first, and use phone bell setting menu.

6.2 Ring volume

- This is to adjust the volume of phone bell.
- It can be adjusted up to 4 levels.
- If volume is changed, sound with suitable volume goes off.

6.3 Ring tone

- This is to select bell sounds upon incoming call.

(general tone : 5 types, melody: 10 types, my bell : 3 types)

- * Upon move to corresponding bell sound, bell goes off.
- * The manner of setting each bell is the same as that of '6.1 Ring type'.
- * If the changed setting is completed, it moves to the initial window.
- * For 'my bell', bell sound can be selected only if there is a melody downloaded.

6. 7. sounds

7.1 Call volume

- This is to adjust the volume of the other party's tone.
- This is divided into 4 levels.

* '*', '#', ▲, ▼ are used.
 * Sound depends on the contents to be changed.

7.2 Key beep

- This is to control the volume of button tone.
- This is divided into 5 steps.
- Same as that of 'Call volume'.

7.3 Connect tone

- Confirm tone that goes off when a call is connected.
- After confirming dial tone, take with the other party.

3. Connect tone

- To execute this function, you should always go through password confirm process.
- Upon product purchase, the password is set to '0000'.

10.1 Lock

- This is to restrict use of phone.
- Upon lock function setting, the state is not changed unless you release the function.
(see '2.8.2 lock function')

10.2. Lock code

- This is used to change the password.
- Upon purchase, the password is set to '0000'.
- If you forget the password, contact the service center.
- * The password contains 4 digits.

10.3 Restrict

- It is the function to restrict the unwanted use of the phone.
- It has two functions: 'Restrict overseas call', 'Origination restriction', 'Prefix 700 restriction'.

* The same procedure is applied for 'Origination restriction' and 'Prefix 700 restriction'.

10.4 Clear Momory

- This is to delete all the contents saved in memory address 001 ~ 200.
 - Take a notice not to erase the number that should not be deleted.
 - For the function of deleting single address, you can delete the desired number through '2. Find entry' of Menu '1. Phone book'.
- (see '4.2 Find entry')

10.5 Emergency

- In emergency condition, user can make a call from the phone book even if outgoing call is restricted
- User can store maximum 3 numbers.

11. Data Service

- Sets the service environment for Internet/PC communication/Fax, etc.

11.1 SIO mode select

- You can set up speed rate when you PC is connected to mobile phone.
- This is only speed rate with Mobil phone with PC , nothing to do speed rate with connection of Internet, fax service.

11.2 Incoming mode

- Modem/ Fax off disables data reception and recognizes incoming calls as voice calls.
- Modem/ Fax off is set as default.
- In “Modem Always” mode, all incoming calls are recognized as asynchronous data calls.
- In “Fax Always” mode, all incoming calls are recognized as Fax calls.
- In fax mode or modem mode, voice-incoming call can't be possible.
-

*Data mode lets you use data service with the serial port on the bottom of your phone.

The transmission rate of the serial port is 19200bps or 115200 bps.

- data mode is set as default.
- DM mode disables data service but lets you download new programs through the serial port on the bottom Of your phone.
- The transmission rate of the serial port is 38400bps.

12. SMS

- It enables the trans-receiving of short messages and the receipt of various information with mobile phone.
- Mobile call paging is possible.
- For SMS menu , ● key is used from side key

12.1 SMS Inbox

- With this function, you may confirm or erase the received message to a mobile phone.

12.2.1 Text

- With this function, you can check the received text message.
- Text messages of up to 50 may be stored .
- Unread message is marked with ☒ and read message is marked with ☐.

Text message	
Erase?	
Yes	No
Next	OK

Text message	
Messages have been erased.	

SMS Inbox	
01. ☐ Examination...	
02. ☐ Seminar, Mon.	
03. ☐ Meeting sched.	
04. ☐ I love you.	
05. ☐ Good night!	
Next	OK

12.2.2 Voice

- With this function, you can check received voice messages.
- The contents is not displayed but the received date and time are.
- It is possible to check voice message through *89

Send

12.2.3 Erase all

- You can erase all of the short/voice messages stored in a mobile phone.

12.2 SMS Outbox

- You can send a message or page a person.
- You can compose a message yourself or send the message by calling the one that is previously stored.

12.2.1 Paging

- You can call a person without a message.

- * If you press 'OK' without a message, the message saying "input the other person's number" is displayed.
- * Upon inputting 'CANCEL' key, input number is disregarded and moves to the upper level menu.
- * Reply number is one's own number; however, it can be modified.
- * The input number can be erased one by one using "CLR" key.

12.2.2 Messaging

- You can send a short message to a person.

12.2.2.1 New MSG

- You can mail a composed message or sent message to the other on the mobile phone.

12.2.2.1 New Message

- Can directly compose messages.

12.2.2.2 Stored Msg

- It is allowed to fetch message prepared in advance to prepare and send message.

12.2.2.3 Message Erase

12.3 SMS Setup

- You can select how to notify the message reception to user.
- It can show the contents of received message on screen or indicate that message arrives.

12.3.1 New Msg Alert

- You can select how to notify the message reception to user.
- Options are 'Vibration + lamp', 'Notify one time', 'Notify every 2min.'

12.3.2 Display text

- Upon receiving message, it can be display part of message or all contents of message.

Safety information

- 1 Wireless phone safety tips**
- 2. Consumer information on SAR (Specific Absorption Rate)**
- 3. TIA safety information**
- 4. FDA Consumer Update**

1. Wireless Phone Safety Tips

Below are safety tips to follow while driving and using a wireless phone.

Your WCE-100 wireless telephone gives you the ability to communicate by voice virtually anywhere, anytime, where CDMA digital wireless phone service is available and safe conditions allow. But an important responsibility accompanies the benefits of wireless phones, one that every user must uphold. When driving a car, driving is your first responsibility. If you find it necessary to use your wireless phone while behind the wheel of a car, practice good common sense and remember the following tips:

1. Get to know your WCE-100 wireless phone and its features such as speed dial and redial. If available, these features help you to place your call without taking your attention off the road.
2. When available, use a hands-free device. If possible, add an additional layer of convenience to your wireless phone with hands-free accessories available today.
3. Position your wireless phone within easy reach. Be able to access your wireless phone without removing your eyes from the road. If you receive an incoming call at an inconvenient time, if possible, let your voice mail answer it for you.
4. Let the person you are speaking with know you are driving; if necessary, suspend the call in heavy traffic or hazardous weather conditions. Rain, sleet, snow, ice, and even heavy traffic can be hazardous.
5. If you receive an incoming call at inconvenient time do not take notes or look up phone numbers while driving. Jotting down a "to do" list or going through your address book takes attention away from your primary responsibility- driving safely.
6. Dial sensibly and access the traffic; if possible, place calls when you are not moving or before pulling into traffic. Try to plan calls when your car will be stationary. If you need to make a call while moving, dial only a few numbers, check the road and your mirrors, then continue.
7. Do not engage in stressful or emotional conversations that may be distracting. Make people you are talking with aware you are driving and suspend conversations which have the potential to divert your attention away from the road.
8. Use your wireless phone to call for help. Dial 9-1-1 or other local emergency number in case of fire, traffic accident or medical emergencies.*
9. Use your wireless phone to help others in emergencies. If you see an auto accident, crime in progress or other serious emergency where lives are in danger, call 9-1-1 or other local emergency number, as you would want others to do for you.*
10. Call roadside assistance or a special non-emergency wireless assistance number when necessary. If you see a broken-down vehicle posing no serious hazard, a broken traffic signal, a minor traffic accident where no one appears injured, or a vehicle you know to be stolen, call roadside assistance or other special non emergency wireless number.

*Wherever wireless phone service is available. Check the laws and regulations on the use of wireless telephones and their accessories in the areas where you drive. Always obey them. The use of these devices may be prohibited or restricted in certain areas.

2. Consumer information on SAR (Specific Absorption Rate)

THIS MODEL PHONE MEETS THE GOVERNMENT'S REQUIREMENTS FOR EXPOSURE TO RADIO WAVES.

This wireless phone has been tested and complies with the Federal Communications Commission (FCC) RF exposure limits for General Population/Uncontrolled exposure environment.

In addition, it complies with the following standards and guidelines.

- FCC 96,326, Guidelines for Evaluating the Environmental Effects of Radio Frequency Radiation.
- FCC OET Bulletin 65 Edition 97-01 (1997) Supplement C, Evaluating Compliance with FCC Guidelines for Human Exposure to Radio Frequency Electromagnetic Fields.
- ANSI/IEEE C95.1 – 1992, IEEE Standard for Safety Levels with Respect to Human Exposure to Radio Frequency Electromagnetic Fields, 3 KHz to 300 GHz.
- ANSI/IEEE C95.3 – 1992, IEEE Recommended Practice for the Measurement of Potentially Hazardous Electromagnetic Fields – RF and Microwave.

The exposure standard for wireless mobile phones employs a unit of measurement known as the Specific Absorption Rate, or SAR. The SAR limit set by the FCC is 1.6W/kg.* Tests for SAR are conducted using standard operating positions specified by the FCC with the phone transmitting at its highest certified power level in all tested frequency bands. Although the SAR is determined at the highest certified power level, the actual SAR level of the phone while operating can be well below the maximum value. This is because the phone is designed to operate at multiple power levels so as to use only the power required to reach the network. In general, the closer you are to a wireless base station antenna, the lower the power output.

Before a phone model is available for sale to the public, it must be tested and certified to the FCC that it does not exceed the limit established by the government-adopted requirement for safe exposure. The tests are performed in positions and locations (e.g., at the ear and worn on the body) as required by the FCC for each model.

The highest SAR value for this model phone when tested for use at the ear is_____ and when worn on the body, as described in this user guide, is_____. (Body-worn measurements differ among phone models, depending upon available accessories and FCC requirements). While there may be differences between the SAR levels of various phones and at various positions, they all meet the government requirement for safe exposure.

The FCC has granted an Equipment Authorization for this model phone with all reported SAR levels evaluated as in compliance with the FCC RF emission guidelines. SAR information on this model phone is on file with the FCC and can be found under the Display Grant section of <http://www.fcc.gov/oet/fccid> after searching on FCC ID _____. Additional information on Specific Absorption Rates (SAR) can be found on the Cellular Telecommunications Industry Association (CTIA) web-site at <http://phonefacts.net>.

For body worn operation, to maintain compliance with FCC RF exposure guidelines, use only WITHUS approved accessories. Use of unauthorized accessories can violates the FCC RF exposure compliance requirements.

* In the United States and Canada, the SAR limit for mobile phones used by the public is 1.6 watts/kg (W/kg) averaged over one gram of tissue. The standard incorporates a substantial margin of safety to give additional protection for the public and to account for any variations in measurements.

3. TIA safety information

Provided herein is the complete TIA Safety Information for Wireless Handheld phones. Inclusion of the text covering Pacemakers, Hearing Aids, and Other Medical Devices is required in the owner's manual for CTIA Certification. Use of the remaining TIA language is encouraged when appropriate.

EXPOSURE TO RADIO FREQUENCY SIGNALS

Your wireless handheld portable telephone is a low power radio transmitter and receiver. When it is ON, it receives and also sends out radio frequency (RF) signals.

In August, 1996, the Federal Communications Commissions (FCC) adopted RF exposure guidelines with safety levels for hand-held wireless phones.

Those guidelines are consistent with the safety standards previously set by both U.S. and international standards bodies:

ANSI C95.1 (1992)*

NCRP Report 86 (1986)

ICNIRP (1996)

Those standards were based on comprehensive and periodic evaluations of the relevant scientific literature. For example, over 120 scientists, engineers, and physicians from universities, government health agencies, and industry reviewed the available body of research to develop the ANSI Standard (C95.1).

The design of your phone complies with the FCC guidelines (and those standards).

ANTENNA CARE

Use only the supplied or an approved replacement antenna. Unauthorized antennas, modifications, or attachments could damage the phone and may violate FCC regulations.

PHONE OPERATION

NORMAL POSITION: Hold the phone as you would any other telephone with the antenna pointed up and over your shoulder.

TIPS ON EFFICIENT OPERATION:

For your phone to operate most efficiently:

- Extend your antenna fully.
- Do not touch the antenna unnecessarily when the phone is in use. Contact with the antenna affects call quality and may cause the phone to operate at a higher power level than otherwise needed.

DRIVING

Check the laws and regulations on the use of wireless telephones in the areas where you drive. Always obey them.

Also, if using your phone while driving, please:

- Give full attention to driving -- driving safely is your first responsibility;
- Use hands-free operation, if available;
- Pull off the road and park before making or answering a call if driving conditions so require.

ELECTRONIC DEVICES

Most modern electronic equipment is shielded from RF signals. However, certain electronic equipment may not be shielded against the RF signals from your wireless phone.

Pacemakers

* American National Standards Institute; National Council on Radiation Protection and Measurements; International Commission on Non-Ionizing Radiation Protection

The Health Industry Manufacturers Association recommends that a minimum separation of six (6") inches be maintained between a handheld wireless phone and a pacemaker to avoid potential interference with the pacemaker. These recommendations are consistent with the independent research by and recommendations of Wireless Technology Research.

Persons with pacemakers:

- Should ALWAYS keep the phone more than six inches from their pacemaker when the phone is turned ON;
- Should not carry the phone in a breast pocket;
- Should use the ear opposite the pacemaker to minimize the potential for interference .
- If you have any reason to suspect that interference is taking place, turn your phone OFF immediately

Hearing Aids

Some digital wireless phones may interfere with some hearing aids. In the event of such interference, you may want to consult your service provider [or call the customer service line to discuss alternatives.] Optional for each phone manufacturer.

Other Medical Devices

If you use any other personal medical device, consult the manufacturer of your device to determine if they are adequately shielded from external RF energy. Your physician may be able to assist you in obtaining this information. Turn your phone OFF in health care facilities when any regulations posted in these areas instruct you to do so. Hospitals or health care facilities may be using equipment that could be sensitive to external RF energy.

Vehicles

RF signals may affect improperly installed or inadequately shielded electronic systems in motor vehicles. Check with the manufacturer or its representative regarding your vehicle. You should also consult the manufacturer of any equipment that has been added to your vehicle.

Posted Facilities

Turn your phone OFF in any facility where posted notices so require.

AIRCRAFT

FCC regulations prohibit using your phone while in the air. Switch OFF your phone before boarding an aircraft.

BLASTING AREAS

To avoid interfering with blasting operations, turn your phone OFF when in a "blasting area" or in areas posted: "Turn off two-way radio". Obey all signs and instructions.

POTENTIALLY EXPLOSIVE ATMOSPHERES

Turn your phone OFF when in any area with a potentially explosive atmosphere and obey all signs and instructions.

Sparks in such areas could cause an explosion or fire resulting in bodily injury or even death.

Areas with a potentially explosive atmosphere are often, but not always marked clearly. Potential areas may include: fueling areas (such as gasoline stations); below deck on boats; fuel or chemical transfer or storage facilities; vehicles using liquefied petroleum gas (such as propane or butane); areas where the air contains chemicals or particles (such as grain, dust, or metal powders); and any other area where you would normally be advised to turn off your vehicle engine.

For Vehicles Equipped with an Air Bag

An air bag inflates with great force. DO NOT place objects, including either installed or portable wireless equipment, in the area over the air bag or in the air bag deployment area. If in-vehicle wireless equipment is improperly installed and the air bag inflates, serious injury could result.

4. FDA Consumer Update

The U.S. Food and Drug Administration's Center for Devices and Radiological Health Consumer Update on Mobile Phones

FDA has been receiving inquiries about the safety of mobile phones, including cellular phones and PCS phones. The following summarizes what is known--and what remains unknown--about whether these products can pose a hazard to health, and what can be done to minimize any potential risk.

This information may be used to respond to questions.

Why the concern?

Mobile phones emit low levels of radio frequency energy (i.e., radio frequency radiation) in the microwave range while being used. They also emit very low levels of radio frequency energy (RF), considered non-significant, when in the stand-by mode. It is well known that high levels of RF can produce biological damage through heating effects (this is how your microwave oven is able to cook food). However, it is not known whether, to what extent, or through what mechanism, lower levels of RF might cause adverse health effects as well. Although some research has been done to address these questions, no clear picture of the biological effects of this type of radiation has emerged to date. Thus, the available science does not allow us to conclude that mobile phones are absolutely safe, or that they are unsafe. However, the available scientific evidence does not demonstrate any adverse health effects associated with the use of mobile phones.

What kinds of phones are in question?

Questions have been raised about hand-held mobile phones, the kind that have a built-in antenna that is positioned close to the user's head during normal telephone conversation. These types of mobile phones are of concern because of the short distance between the phone's antenna--the primary source of the RF--and the person's head. The exposure to RF from mobile phones in which the antenna is located at greater distances from the user (on the outside of a car, for example) is drastically lower than that from hand-held phones, because a person's RF exposure decreases rapidly with distance from the source.

The safety of so-called "cordless phones," which have a base unit connected to the telephone wiring in a house and which operate at far lower power levels and frequencies, has not been questioned.

How much evidence is there that hand-held mobile phones might be harmful?

Briefly, there is not enough evidence to know for sure, either way; however, research efforts are on-going. The existing scientific evidence is conflicting and many of the studies that have been done to date have suffered from flaws in their research methods. Animal experiments investigating the effects of RF exposures characteristic of mobile phones have yielded conflicting results.

A few animal studies, however, have suggested that low levels of RF could accelerate the development of cancer in laboratory animals. In one study, mice genetically altered to be predisposed to developing one type of cancer developed more than twice as many such cancers when they were exposed to RF energy compared to controls.

There is much uncertainty among scientists about whether results obtained from animal studies apply to the use of mobile phones. First, it is uncertain how to apply the results obtained in rats and mice to humans. Second, many of the studies that showed increased tumor development used animals that had already been treated with cancer-causing chemicals, and other studies exposed the animals to the RF virtually continuously--up to 22 hours per day.

For the past five years in the United States, the mobile phone industry has supported research into the safety of mobile phones. This research has resulted in two findings in particular that merit additional study:

1. In a hospital-based, case-control study, researchers looked for an association between mobile phone use and either glioma (a type of brain cancer) or acoustic neuroma (a benign tumor of the nerve sheath). No statistically significant association was found between mobile phone use and acoustic neuronal.

There was also no association between mobile phone use and gliomas when all types of gliomas were considered together. It should be noted that the average length of mobile phone exposure in this study was less than three years.

When 20 types of glioma were considered separately, however, an association was found between mobile phone use and one rare type of glioma, neuroepitheliomatous tumors. It is possible with multiple comparisons of the same sample that this association occurred by chance. Moreover, the risk did not increase with how often the mobile phone was used, or the length of the calls. In fact, the risk actually decreased with cumulative hours of mobile phone use. Most cancer-causing agents increase risk with increased exposure. An ongoing study of brain cancers by the National Cancer Institute is expected to bear on the accuracy and repeatability of these results.²

2. Researchers conducted a large battery of laboratory tests to assess the effects of exposure to mobile phone RF on genetic material. These included tests for several kinds of abnormalities, including mutations, chromosomal aberrations, DNA strand breaks, and structural changes in the genetic material of blood cells called lymphocytes. None of the tests showed any effect of the RF except for the micronucleus assay, which detects structural effects on the genetic material. The cells in this assay showed changes after exposure to simulated cell phone radiation, but only after 24 hours of exposure. It is possible that exposing the test cells to radiation for this long resulted in heating. Since this assay is known to be sensitive to heating, heat alone could have caused the abnormalities to occur. The data already in the literature on the response of the micronucleus assay to RF are conflicting. Thus, follow-up research is necessary.

FDA is currently working with government, industry, and academic groups to ensure the proper follow-up to these industry-funded research findings. Collaboration with the Cellular Telecommunications Industry Association (CTIA) in particular is expected to lead to FDA providing research recommendations and scientific oversight of new CTIA-funded research based on such recommendations.

Two other studies of interest have been reported recently in the literature:

1. Two groups of 18 people were exposed to simulated mobile phone signals under laboratory conditions while they performed cognitive function tests. There were no changes in the subjects' ability to recall words, numbers, or pictures, or in their spatial memory, but they were able to make choices more quickly in one visual test when they were exposed to simulated mobile phone signals. This was the only change noted among more than 20 variables compared.⁴
2. In a study of 209 brain tumor cases and 425 matched controls, there was no increased risk of brain tumors associated with mobile phone use. When tumors did exist in certain locations, however, they were more likely to be on the side of the head where the mobile phone was used. Because this occurred in only a small number of cases, the increased likelihood was too small to be statistically significant.⁵

In summary, we do not have enough information at this point to assure the public that there are, or are not, any low incident health problems associated with use of mobile phones. FDA continues to work with all parties, including other federal agencies and industry, to assure that research is undertaken to provide the necessary answers to the outstanding questions about the safety of mobile phones.

5 Hardell, L, Nasman, A, Pahlson, A, Hallquist, A and Mild, KH. Use of cellular telephones and the risk for brain tumors: a case-control study. *Int. J. Oncol.*, 15: 113-116, 1999.

What is known about cases of human cancer that have been reported in users of hand-held mobile phones?

Some people who have used mobile phones have been diagnosed with brain cancer. But it is important to understand that this type of cancer also occurs among people who have not used mobile phones. In fact, brain cancer occurs in the U.S. population at a rate of about 6 new cases per 100,000 people each year. At that rate, assuming 80 million users of mobile phones (a number increasing at a rate of about 1 million per month), about 4800 cases of brain cancer would be expected each year among those 80 million people, whether or not they used their phones. Thus it is not possible to tell whether any individual's cancer arose because of the phone, or whether it would have happened anyway. A key question is whether the risk of getting a particular form of cancer is greater among people who use mobile phones than among the rest of the population. One way to answer that question is to compare the usage of mobile phones among people with brain cancer with the use of mobile phones among appropriately matched people without brain cancer. This is called a case-control study. The current case-control study of brain cancers by the National Cancer Institute, as well as the follow-up research to be sponsored by industry, will begin to generate this type of information.

What is FDA's role concerning the safety of mobile phones?

Under the law, FDA does not review the safety of radiation-emitting consumer products such as mobile phones before marketing, as it does with new drugs or medical devices. However, the agency has authority to take action if mobile phones are shown to emit radiation at a level that is hazardous to the user.

In such a case, FDA could require the manufacturers of mobile phones to notify users of the health hazard and to repair, replace or recall the phones so that the hazard no longer exists.

Although the existing scientific data do not justify FDA regulatory actions at this time, FDA has urged the mobile phone industry to take a number of steps to assure public safety. The agency has recommended that the industry:

- " support needed research into possible biological effects of RF of the type emitted by mobile phones;
- " design mobile phones in a way that minimizes any RF exposure to the user that is not necessary for device function ;
- and
- " cooperate in providing mobile phone users with the best possible information on what is known about possible effects of mobile phone use on human health.

At the same time, FDA belongs to an interagency working group of the federal agencies that have responsibility for different aspects of mobile phone safety to ensure a coordinated effort at the federal level. These agencies are:

- " National Institute for Occupational Safety and Health
- " Environmental Protection Agency
- " Federal Communications Commission
- " Occupational Health and Safety Administration
- " National Telecommunications and Information Administration

The National Institutes of Health also participates in this group.

In the absence of conclusive information about any possible risk, what can concerned individuals do?

If there is a risk from these products--and at this point we do not know that there is--it is probably very small. But if people are concerned about avoiding even potential risks, there are simple steps they can take to do so. For example, time is a key factor in how much exposure a person receives. Those persons who spend long periods of time on their hand-held mobile phones could consider holding lengthy conversations on conventional phones and reserving the hand-held models for shorter conversations or for situations when other types of phones are not available.

People who must conduct extended conversations in their cars every day could switch to a type of mobile phone that places more distance between their bodies and the source of the RF, since the exposure level drops off dramatically with distance. For example, they could switch to:

- " a mobile phone in which the antenna is located outside the vehicle,
- " a hand-held phone with a built-in antenna connected to a different antenna mounted on the outside of the car or built into a separate package, or
- " a headset with a remote antenna to a mobile phone carried at the waist.

Again, the scientific data do not demonstrate that mobile phones are harmful. But if people are concerned about the radio frequency energy from these products, taking the simple precautions outlined above can reduce any possible risk.

Where can I find additional information?
